## **Copyright Information**

© 2023 Delta Tau Data Systems, Inc. All rights reserved.

This document is furnished for the customers of Delta Tau Data Systems, Inc. Other uses are unauthorized without written permission of Delta Tau Data Systems, Inc. Information contained in this manual may be updated from time-to-time due to product improvements, etc., and may not conform in every respect to former issues.

To report errors or inconsistencies, call or email your local Omron representative

## **Operating Conditions**

All Delta Tau Data Systems, Inc. motion controller products, accessories, and amplifiers contain static sensitive components that can be damaged by incorrect handling. When installing or handling Delta Tau Data Systems, Inc. products, avoid contact with highly insulated materials. Only qualified personnel should be allowed to handle this equipment. Before powering, please ensure there is no visible damage to the product.

In the case of industrial applications, we expect our products to be protected from hazardous or conductive materials and/or environments that could cause harm to the controller by damaging components or causing electrical shorts. Our products should not be placed in locations that can accrue a lot of dust, salt, or conductive iron-like powder. When our products are used in an industrial environment, install them into an industrial electrical cabinet or industrial PC to protect them from excessive or corrosive moisture, abnormal ambient temperatures, and conductive materials. If Delta Tau Data Systems, Inc. products are directly exposed to hazardous or conductive materials and/or environments, we cannot guarantee their operation. For your own safety, please keep the product's environmental conditions within the range outlined by the Environment Specifications section that can be located from the table of contents in this manual.

#### **Trademarks**

Other company names and product names in this document are the trademarks or registered trademarks of their respective companies.

## **Safety Instructions**

Qualified personnel must transport, assemble, install, and maintain this equipment. Properly qualified personnel are persons who are familiar with the transport, assembly, installation, and operation of equipment. The qualified personnel must know and observe the following standards and regulations:

IEC364resp.CENELEC HD 384 or DIN VDE 0100

IEC report 664 or DIN VDE 0110

National regulations for safety and accident prevention or VBG 4

Incorrect handling of products can result in injury and damage to persons and machinery. Strictly adhere to the installation instructions. Electrical safety is provided through a low-resistance earth connection. It is vital to ensure that all system components are connected to earth ground.

This product contains components that are sensitive to static electricity and can be damaged by incorrect handling. Avoid contact with high insulating materials (artificial fabrics, plastic film, etc.). Place the product on a conductive surface. Discharge any possible static electricity build-up by touching an unpainted, metal, grounded surface before touching the equipment.

Keep all covers and cabinet doors shut during operation. Be aware that during operation, the product has electrically charged components and hot surfaces. Control and power cables can carry a high voltage, even when the motor is not rotating. Never disconnect or connect the product while the power source is energized to avoid electric arcing.

A Warning identifies hazards that could result in personal injury or death. It precedes the discussion of interest.

Warning

A Caution identifies hazards that could result in equipment damage. It precedes the discussion of interest.

**Caution** 

A Note identifies information critical to the understanding or use of the equipment. It follows the discussion of interest.

Note

## **INTRODUCTION**

This manual provides the information needed to configure ACC-72EX, a fieldbus/real-time Ethernet interface for the Turbo or Power UMAC. The ACC-72EX is equipped with a "gateway" daughter card that allows the UMAC (also referred to as host application) to send and receive data through the supported fieldbus/real-time Ethernet protocols. The gateway used is the COMX CN series manufactured by the Hilscher Corporation. Relevant hyperlinks are provided in Appendix D for in-depth information regarding these modules.

There are three connectors located on the front of the ACC-72EX:

First, a Micro B USB connector, which is specified as "Diagnostic Port," and provides USB connectivity to Hilscher's "SyCon.NET" software.

The second connector, which is referred to as the "Fieldbus Port", is a 9-Pin Male D-Sub connector which is used for connecting the fieldbus link to ACC-72EX. The fieldbus protocols supported through this port are:

- PROFIBUS-DP Master OPT10
- PROFIBUS-DP Slave OPT11
- DeviceNet Master OPT20
- DeviceNet Slave OPT21
- CANopen Master OPT30
- CANopen Slave OPT31 (No Longer Available)
- *CC-Link Slave OPT51 (No Longer Available)*

The third connector is composed of two RJ-45 ports which provide connection to real-time Ethernet networks. The following real-time Ethernet protocols are supported through these ports:

- EtherCAT Master OPT60
- EtherCAT Slave OPT61
- EtherNet/IP Scanner/Master OPT70
- EtherNet/IP Adaptor/Slave OPT71
- Open Modbus/TCP OPT80
- PROFINET IO Controller OPT90
- PROFINET IO Device OPT91

The protocol is dependent upon the equipped COMX gateway. The hardware cannot be programmed for an alternate protocol or change from slave to master or vice versa. However, should the COMX gateway be replaced with one supporting another protocol, the baseboard would function properly as a communications link to UMAC. In this case, proper jumper settings should be set up to ensure proper functionality on communication lines and option detection.

Most gateway cards get their power from the UBUS back plane; however, the DeviceNet option (Options 3 & 4) requires an external 24 VDC power supply through the "Fieldbus Port."

## 사용자안내문

이 기기는 업무용 환경에서 사용할 목적으로 적합성평가를 받은 기기로서 가정용 환경에서 사용하는 경우 전파간섭의 우려가 있습니다.

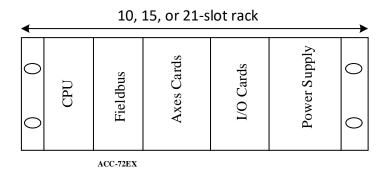

## 한국 EMC적용제품 준수사항

본 제품은 전파법(KC 규정)을 준수합니다. 제품을 사용하려면 다음 사항에 유의하십시오. 이 기기는 업무용 환경에서 사용할 목적으로 적합성평가를 받은 기기로서 가정용 환경에서 사용하는 경우 전파간섭의 우려가 있습니다. 입력에 EMC 필터, 서지 보호기, 페라이트 코어 또는 1차측의 케이블에 노이즈 필터를 입력으로 사용하십시오.

Specifications 10

## **MOUNTING AND INSTALLATION**

To connect a UMAC accessory, simply slide the board into any open slot of the UMAC rack. Customarily, accessories are installed from left to right as follows:

Prior to installation, make sure that you have set the jumpers and address settings to your desired requirements. Use the guide tracks that have been installed in the empty slots of your UMAC system when installing a board.

As you slide the board into the rack, use caution to ensure none of the components on the board make contact with the front plates of the boards on either side. Getting the front plate flush with the front of the rack and turning the front screws firmly will ensure a good connection with the backplane.

When removing a board from the system, the user must first pull out any wired connections from the top, bottom, and front panels then loosen the pem-nuts on the front of the rack. Next, the user can gently pull the board from the rack and use caution to ensure that none of the components on the board make contact with the boards on either side.

Warning

System malfunction can occur due to noise/chatter if the ACC-72EX is placed outside of the recommended order as seen in the illustration above. Note that the ACC-72EX is a Fieldbus device and should be placed adjacent to the CPU, and as close as possible to ensure smooth communication.

## THEORY OF OPERATION

The ACC-72EX board is organized as a motherboard/daughter board system. The motherboard contains the UBUS interface, diagnostics, and the fieldbus connections. The daughter board contains the intelligence (firmware which will be referred as netX) and the interface electronics required for each fieldbus. There is a different daughter board for each fieldbus.

The netX firmware on the daughter board implements each fieldbus communications protocol. Fieldbus data is transferred to/from the fieldbus and placed in a Dual-Ported RAM (memory) on the daughter board. The structure of this DPRAM is given later in this manual and is common for all the field buses. ACC-72EX supports up to 64K DPRAM on each device (one full chip-select width).

The PMAC side of the DPRAM is interfaced to the UBUS. PMAC programs access the fieldbus data by reading or writing data to memory addresses corresponding to the location of the PMAC Gateway 3U board's DPRAM.

#### **UBUS** Interface

The UBUS is Delta Tau's bus interface for the UMAC controller. The ACC-72EX maps to the UBUS as a DPRAM style board. It occupies contiguous memory locations (both X and Y memory for Turbo PMAC) of the lower two bytes of the 24-bit (middle 16 bits of each 32 bit word for Power PMAC), DPRAM addresses. Because the DPRAM size supported on ACC-72EX can be as large as 64K, each card will occupy one full Chip Select addressing space. There can be a maximum of two ACC-72EX cards per Turbo/Power UMAC (cannot be in a MACRO Station).

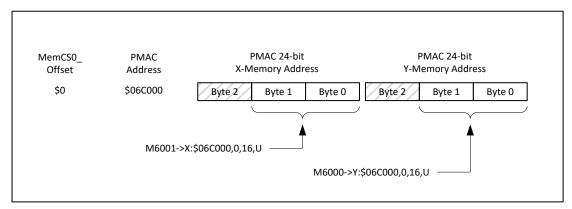

M-Variables can be mapped to these locations to move data to and from the fieldbus and PMAC. In addition to fieldbus data, there is a block of memory that indicates the ACC-72EX's status.

#### **How ACC-72EX Works**

- 1. The ACC-72EX organizes fieldbus bytes in dual-port memory on the COMX module. These fieldbus bytes are mapped into PMAC's memory space via the UBUS interface.
- 2. PMAC M-Variables are used to move data to and from the fieldbus or to control the COMX board.
- 3. An E-point jumper on the ACC-72EX sets the address of the board in PMAC memory space.
- 4. The COMX board is configurable via a USB port. SYCON.NET is provided with the COMX board for this purpose.
- 5. Diagnostic LEDs are provided for a visual indication of board status.

## **Turbo PMAC Memory**

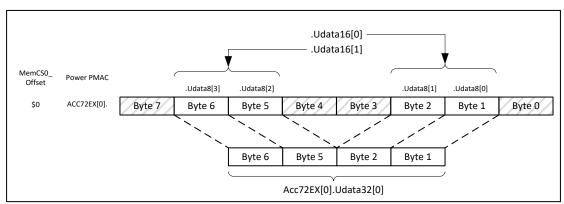

Turbo PMAC uses a DSP (Digital Signal Processor) with a 24-Bit architecture that uses two memory areas: Y and X Memory. Memory is accessed in PMAC programs using M-Variables. The definition of an M-Variable includes its number, address, offset, width, and type. Refer to the Turbo PMAC Software Reference Manual or Turbo PMAC User Manual for additional explanation of M-Variables and their specification, such as in the "M-Variables" section in the User manual.

**Turbo PMAC Memory Organization** 

## **Power PMAC Memory**

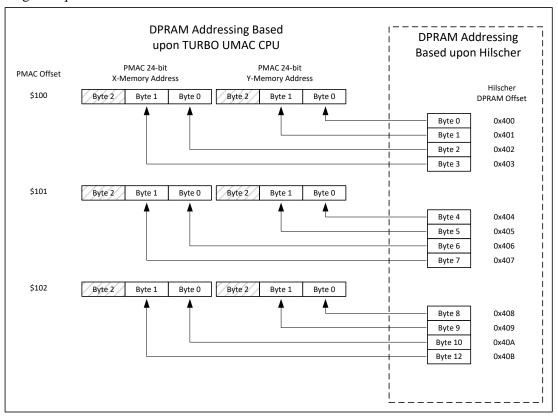

Power PMAC uses 32-bit data bus architecture. ACC-72EX Memory is accessed in Power PMAC data structures or their equivalent #define statements. The #define statements are included later in this manual.

**Power PMAC Memory Organization** 

## Hilscher ComX Module Addressing to Turbo PMAC Addressing Conversion

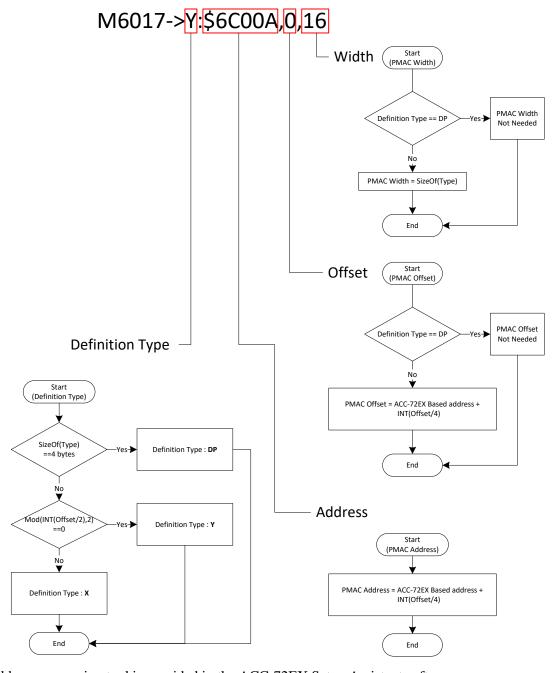

As explained in previous sections, Turbo PMAC places 4 bytes of Hilscher ComX memory data in each PMAC memory word. This means that for each address offset increment on the PMAC side, there will be 4 increments of offset addresses on the Hilscher DPRAM side. The following example shows PMAC addressing for equivalent offset addresses of 0x400 in Hilscher documentation.

**Consumed Data Flow** 

In general, the following flowcharts can be used to convert any Hilscher DPRAM addressing to PMAC's addressing format:

System Info	System Information Block						
Offset Type Name Description							
0x0028	UINT16	usDeviceClass	Device Class netX Device Class (see page 34)				

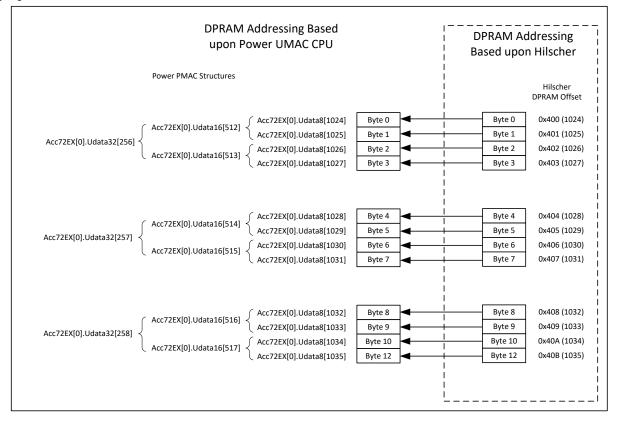

An address conversion tool is provided in the ACC-72EX Setup Assistant software.

## Hilscher ComX Module Addressing to Power PMAC Addressing Conversion

In Power PMAC, specific **Acc72EX**[*i*] data structures have been implemented which allow bit-wide, byte-wide, 2-byte and 4-byte access to Hilscher ComX Dual Ported RAM.

**Acc72EX**[*i*].**Udata16**[*j*] structures can be used for individual bit access, both for read and for write purpose.

## **HARDWARE**

## E3: UBUS Address

E-point jumper E3 on the ACC-72EX controls the base address and range on the UBUS. Since each ACC-72EX uses full-13 bit addressing, it consumes all the memory addressable through each chip select. As a result, two is the maximum number of ACC-72EX boards that can be used in a Turbo UMAC rack.

	E3	Turbo PMAC	Power PMAC
Ī	1-2	Y/X:\$6C000 - \$6FFFF	ACC-72EX[0] (\$E00000)
Ī	2-3	Y/X:\$74000 - \$7FFFF	ACC-72EX[1] (\$F00000)

The default location on Turbo PMAC is Y/X:\$6C000 - \$6FFFF (\$E00000 on Power PMAC).

#### Note:

Do not set the ACC-72EX to the DPR address range \$6C000-\$6FFFF if the UMAC is equipped with an Acc-54E. Acc-54E is set to this range as default.

#### **CS16- Identification**

One of the features of the UBUS is that memory locations, selected by CS16 (Chip Select 16/Active Low), were reserved for board identification information.

Vendor ID (8 bits)
Options Present (10 bits)
Revision Number (4 bits)
Product ID (14 bits)

This information (36 bits) is accessible directly with I-Variables added in Turbo PMAC Firmware 1.936 or later. A summary of the PMAC Gateway ID information is in the table below.

I39 controls the values reported.

I39=	I4942I4952 reports the following
0	36 bits (Vendor ID, Options present, Rev Number, Product ID)
1	8 bits (Vendor ID)
2	10 bits (Options Present) Reported by PMAC in HEX (\$)
3	4 bits (Revision Number)
4	14 bits (Product ID)
5	19 bits (Card Base Address)

#### **Identification Information**

The vendor ID, part number, and revision numbers are programmed into the ACC-72EX base board. The Option Number is set by jumpers on the board. The settings below are given for reference only. There is no need to change these from the factory settings.

## **Jumper Settings**

## **E-Point Jumper Settings**

Point	Default	Description
E1	1-2	Selection of Reset Polarity Signal for Hilscher Module:
		1-2 Selects Low True Reset
		2-3 Selects High True Reset
E2	2-3	Selection of UMAC CPU architecture. This selection affects the data bus and provides
		contiguous data addressing for the DPRAM:
		1-2 Turbo PMAC
		2-3 Power PMAC
E3	1-2	Selection of base address for ACC-72EX:
		1-2 Selects Y/X:\$6C000 - \$6FFFF ( <b>Acc72EX[0</b> ])
		2-3 Selects Y/X:\$74000 - \$7FFFF ( <b>Acc72EX[1</b> ])
E5	OFF	Connects DPRAM interrupt to UBUS IRQ-1
E6	OFF	Connects DPRAM interrupt to UBUS IRQ-2
E7	OFF	Connects DPRAM interrupt to UBUS IRQ-3

## **Communication Option-Dependent E-Point Jumper Settings**

Comm. Protocol Option	Option Part Number	E8	E10	E11	E12
PROFIBUS-DP – Master	310-603958-OPT	1-2	OFF	OFF	OFF
PROFIBUS-DP – Slave	311-603958-OPT	1-2	OFF	OFF	OFF
DeviceNet – Master	320-603958-OPT	2-3	ON	OFF	OFF
DeviceNet – Slave	321-603958-OPT	2-3	ON	OFF	OFF

Real-time Ethernet Ports (Ethernet 0 & Ethernet 1)

Pin No.	Symbol	Description
1	RX+	Receive+
2	RX-	Receive-
3	TX+	Transmit+
4		
5		
6	TX-	Transmit-
7		
8		

**Diagnostics Port (Micro A USB)** 

Pin No.	Symbol	Description
1	VBUS	+5 VDC (Not connected to ACC-72EX +5 VDC )
2	D-	Data -
3	D+	Data +
4	GND	Ground Reference (Connected to ACC-72EX and UMAC's Digital Ground)

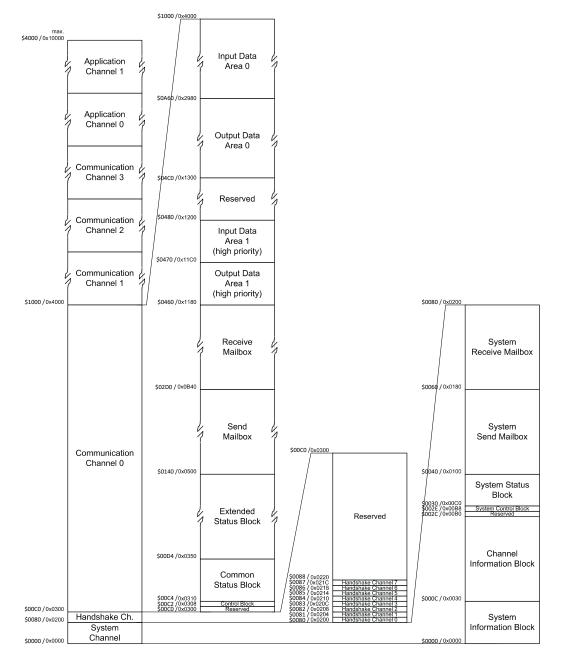

### Note:

The USB connection is not a galvanically isolated connection. The ground of the PC will be connected to the ground of the UMAC system through the USB connection, which can damage components on the PC and/or ACC-72EX. Make sure that there is no potential difference between the grounds on both ends.

## **DPRAM MEMORY MAP**

Below is the standard memory map of address offsets found in the DPRAM of the ACC-72EX module. Start and end addresses for each of the memory blocks are specified both in Hilscher offset (0x notation for hexadecimal) and Turbo PMAC offset (\$ notation for hexadecimal) notation. The memory map shown here is the standard memory map. Different COMX modules may have different memory maps. Please refer to the Hilscher manual for each COMX module for detailed information.

These registers should be read from and written to using M-Variables which point to the lower 16 bits of the X/Y-memory with an offset from the base address that is configured with E3. Handshake and System registers are common between all protocols, and others can be auto-generated using the "ACC-72EX Setup Assistant" software.

### **DPRAM Blocks**

In the Hilscher COMX module DPRAM, the system channel and the handshake channel are always present. These channels are used for communicating with the firmware on the COMX module, from this point on referred to as "netX."

The system channel provides information about the state of the COMX module operating system, netX, and the structure of the dual-port memory. It allows basic communication via system mailboxes.

The handshake channel provides a bit toggle mechanism that insures synchronizing data transfer between the UMAC and COMX module. All handshake cells from system, communication, and application channels are brought together in this one location.

Next are the communication and application channels. A communication channel provides network access and occupies an area of the COMX dual-port memory with process, non-cyclic, and diagnostic data. An application channel can be used for any functionality that may be executed in the context of the netX operating system. The application channels are not supported by COMX modules at the time of writing this manual.

## **DPRAM Suggested Macro Names**

ACC-72EX Setup Assistant software, available through the Tools menu in PEWIN32PRO2 software, provides a complete overview of blocks and sub-blocks available to each ACC-72EX. Under each section is a list of macro names provided for M-Variable definition.

For more information on structures and data registers in COMX modules, please refer to references introduced in appendix A of this manual.

## **System Channel**

The System Channel is the first of the channels in the dual-port memory and starts at address offset \$0000. It holds information about the system itself (netX, netX operating system) and provides a mailbox transfer mechanism for system-related messages or packets.

ACC-72EX Setup Assistant software uses the data available in this channel to generate the information in the memory map output file.

#### **System Information Block**

The first block of information allows identification of the netX dual memory; it is used for testing proper communication. The first 4 registers hold character values for "netX" (110, 101, 116, 88). If these values are reading properly, the DPRAM communication is in working condition.

#### System Mailbox

The system mailbox is the "window" to the operating system. It is always present even if no firmware is loaded. For more information about using system send/receive mailboxes, please see the examples shown in the following chapters. A complete list of functions, which can be accessed using the mailboxes, can be found in the netX Dual-Ported Memory Interface document available from Hilscher.

#### **Handshake Channel**

The handshake channel provides a mechanism that allows the synchronizing of data transfer between the UMAC CPU and ACC-72EX dual-port memory. The handshake channel brings all handshake registers from other channel blocks together in one location. The handshake register could be moved from the handshake block to the beginning of each of the communication channels.

There are three types of handshake cells, described below.

### System Handshake Cells

System handshake flags are used to synchronize data transfer between the ACC-72EX Hilscher Module and UMAC via the system mailbox and to handle certain changes of state function. They also hold information about the status of the ACC-72EX Hilscher module and can be used to execute certain commands in the module (for a module-wide reset, for example).

There are two sets of system flags. One set is dedicated for netX writes and is read by UMAC, and the other one is designated for UMAC writes. netX is continuously reading the second set.

## netX System Flags

The ACC-72EX Hilscher module firmware writes to the netX system register; UMAC reads this register. The netX system register is located at address offset \$80 in the dual-port memory.

bNetxFlags – netX writes, UMAC reads Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 8 7 6 5 4 3 2 1 0 NSF\_RECV\_MBX\_CMD NSF\_NETX\_COS\_CMD NSF\_SEND\_MBX\_ACK NSF\_HOST\_COS\_ACK Function Reserved NSF\_ERROR NSF\_READY

netX System Flags **bNetxFlags** (ACC-72EX ⇒ UMAC)

Bit No.	Definition / Description
	Ready (NSF_READY)
0	The Ready flag is set as soon as the COMX has initialized itself properly and passed its
	self-test. When the flag is set, the netX is ready to accept packets via the system mailbox.
	If cleared, the netX does not accept any packages.
	Error (NSF_ERROR)
	The Error flag is set when the netX has detected an internal error condition. This is
1	considered to be a fatal error. The Ready flag is cleared and the netX operating system is
	stopped. An error code helping to identify the issue is placed in the ulSystemError
	variable in the system status block.
	Host Change Of State Acknowledge (NSF_HOST_COS_ACK)
2	The Host Change of State Acknowledge flag is set when the netX acknowledges a
_	command from the host system. This flag is used together with the Host Change of State
	Command flag in the host system flags.
	netX Change Of State Command (NSF_NETX_COS_CMD)
3	The netX Change of State Command flag is set if the netX signals a change of its state to
	the host system. Details of what has changed can be found in the ulSystemCOS variable
-	in the system control block.
,	Send Mailbox Acknowledge (NSF_SEND_MBX_ACK)
4	Both the Send Mailbox Acknowledge flag and the Send Mailbox Command flag are used
	together to transfer non-cyclic packages between the UMAC and the netX.
_	Receive Mailbox Command (NSF_RECV_MBX_CMD)
5	Both the Receive Mailbox Command flag and the Receive Mailbox Acknowledge flag are
	used together to transfer non-cyclic packages between the netX and UMAC.

## **Host System Flags**

Bit No.

6, 7 ...

15

**Definition / Description** 

6, 7 ... 15 Reserved; set to zero

The host system flags are written by UMAC; the netX reads these flags. The host system register is located at address offset \$81 in the dual-port memory.

bHostFlags – UMAC writes, netX reads 15 | 14 | 13 | 12 | 11 | 10 8 7 6 3 2 0 1 HSF\_SEND\_MBX\_CMD HSF\_HOST\_COS\_CMD HSF\_RECV\_MBX\_ACK HSF\_NETX\_COS\_ACK HSF\_BOOTSTART Reserved HSF\_RESET

Host System Flags **bHostFlags** (UMAC ⇒ ACC-72EX)

0	Reset (HSF_RESET) The Reset flag is set by the UMAC to execute a system wide reset. This forces the system to restart. All network connections are interrupted immediately regardless of their current state.
1	Bootstart (HSF_BOOTSTART) If set during reset, the Boot-Start flag forces the netX to stay in boot loader mode; a firmware that may reside in the context of the operating system rcX is not started. If cleared during reset, the operating system will start the firmware if available.
2	Host Change Of State Command (HSF_HOST_COS_CMD) The Host Change of State Command flag is set by the UMAC to signal a change of its state to the netX. Details of what has changed can be found in the ulSystemCommandCOS variable in the system control block.
3	netX Change Of State Acknowledge (HSF_NETX_COS_ACK) The netX Change of State Acknowledge flag is set by the UMAC to acknowledge the new state of the netX. This flag is used together with the netX Change of State Command flag in the netX system flags.
4	Send Mailbox Command (HSF_SEND_MBX_CMD)  Both the Send Mailbox Command flag and the Send Mailbox Acknowledge flag are used together to transfer non-cyclic packages between the UMAC and the netX.
5	Receive Mailbox Acknowledge (HSF_RECV_MBX_ACK) Both the Receive Mailbox Acknowledge flag and the Receive Mailbox Command flag are

used together to transfer non-cyclic packages between the netX and the UMAC.

#### Communication Channel Handshake Cells

The channel handshake register is used to indicate the status of the protocol stack as well as execute certain commands in the protocol stack (e.g. reset a channel or synchronization of process data). The mailbox flags are used to send and receive non-cyclic messages via the channel mailboxes.

There are two sets of Communication Channel flags. One set is dedicated for netX writes; UMAC continually reads this. The other set is designated for UMAC writes; netX continuously reads this.

#### netX Communication Flags

This flag register is organized as a bit field. The netX protocol stack writes to the register to control data synchronization via the mailbox system and the process data image. It also informs the UMAC about its current network state. The UMAC reads this register.

usNetxFlags – netX writes, UMAC reads

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Function			Rese	erved	I		NCF_PD1_IN_CMD (not supported yet)	NCF_PD1_OUT_ACK (not supported yet)	NCF_PD0_IN_CMD	NCF_PD0_OUT_ACK	NCF_RECV_MBX_CMD	NCF_SEND_MBX_ACK	NCF_NETX_COS_CMD	NCF_HOST_COS_ACK	NCF_ERROR	NCF_COMMUNICATING

Communication Channel Flags **usNetXFlags** (ACC-72EX ⇒ UMAC)

Bit No.	Definition / Description
0	Communicating (NCF_COMMUNICATING) The NCF_COMMUNICATING flag is set if the protocol stack has successfully opened a connection to at least one of the configured network slaves (for master protocol stacks), respectively has an open connection to the network master (for slave protocol stacks). If cleared, the input data should not be evaluated, because it may be invalid, old or both. At initialization time, this flag is cleared.
1	Error (NCF_ERROR) The NCF_ERROR flag signals an error condition that is reported by the protocol stack. It could indicate a network communication issue or something to that effect. The corresponding error code is placed in the ulCommunicationError variable in the common status block. At initialization time, this flag is cleared.
2	Host Change Of State Acknowledge (NCF_HOST_COS_ACK) The NCF_HOST_COS_ACK flag is used by the protocol stack indicating that the new state of the UMAC has been read. At initialization time, this flag is cleared.
3	netX Change Of State Command (NCF_NETX_COS_CMD)  The NCF_NETX_COS_CMD flag signals a change in the state of the protocol stack. The new state can be found in the ulCommunicationCOS register in the common status block. In return the UMAC program then toggles the HCF_NETX_COS_ACK flag in the host communication flags acknowledging that the new protocol state has been read. At initialization time, this flag is cleared.
4	Send Mailbox Acknowledge (NCF_SEND_MBX_ACK)  Both the NCF_SEND_MBX_ACK flag and the HCF_SEND_MBX_CMD flag are used together to transfer non-cyclic packages between the protocol stack and the UMAC programs. At initialization time, this flag is cleared.
5	Receive Mailbox Command (NCF_RECV_MBX_CMD)  Both the NCF_RECV_MBX_CMD flag and the HCF_RECV_MBX_ACK flag are used together to transfer non-cyclic packages between the UMAC programs and the protocol stack. At initialization time, this flag is cleared.
6	Process Data 0 Out Acknowledge (NCF_PD0_OUT_ACK)  Both the NCF_PD0_OUT_ACK flag and the HCF_PD0_OUT_CMD flag are used together to transfer cyclic output data from the UMAC to the protocol stack. At initialization time, this flag may be set, depending on the data exchanged mode.
7	Process Data 0 In Command (NCF_PD0_IN_CMD)  Both the NCF_PD0_IN_CMD flag and the HCF_PD0_IN_ACK flag are used together to transfer cyclic input data from the protocol stack to the UMAC. At initialization time, this flag may be set, depending on the data exchanged mode.
8	Process Data 1 Out Acknowledge (NCF_PD1_OUT_ACK, not supported yet)  Both the NCF_PD1_OUT_ACK flag and the HCF_PD1_OUT_CMD flag are used together to transfer output cyclic data from the UMAC to the protocol stack. At initialization time, this flag may be set, depending on the data exchanged mode.
9	Process Data 1 In Command (NCF_PD1_IN_CMD, not supported yet) Both the NCF_PD1_IN_CMD flag and the HCF_PD1_IN_ACK flag are used together to transfer cyclic input data from the protocol stack to the UMAC. At initialization time, this flag may be set, depending on the data exchange mode.

## **Host Communication Flags**

This flag register is organized as a bit field. UMAC writes to this register to control data synchronization via the mailbox system and the process data image. The netX protocol stack reads this register.

usHostFlags – UMAC writes, netX reads

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Function			Rese	rved			HCF_PD1_IN_ACK (not supported yet)	HCF_PD1_OUT_CMD (not supported yet)	HCF_PD0_IN_ACK	HCF_PD0_OUT_CMD	HCF_RECV_MBX_ACK	HCF_SEND_MBX_CMD	HCF_NETX_COS_ACK	HCF_HOST_COS_CMD		

Communication Channel Flags usHostFlags (UMAC ⇒ ACC-72EX)

Bit No.	Definition / Description
0, 1	Reserved, set to 0
2	Host Change Of State Command (HCF_HOST_COS_CMD) The HCF_HOST_COS_CMD flag signals a change in the state of the UMAC. A new state is set in the ulApplicationCOS variable in the communication control block. The protocol stack on the netX then toggles the NCF_HOST_COS_ACK flag in the netX communication flags back acknowledging that the new state has been read. At initialization time, this flag is cleared.
3	Host Change Of State Acknowledge (HCF_NETX_COS_ACK) The HCF_NETX_COS_ACK flag is used by UMAC to indicate that the new state of the protocol stack has been read. At initialization time, this flag is cleared.
4	Send Mailbox Command (HCF_SEND_MBX_CMD)  Both the HCF_SEND_MBX_CMD flag and the NCF_SEND_MBX_ACK flag are used together to transfer non-cyclic packages between the UMAC and the protocol stack. At initialization time, this flag is cleared.
5	Receive Mailbox Acknowledge (HCF_RECV_MBX_ACK) Both the HCF_RECV_MBX_ACK flag and the NCF_RECV_MBX_CMD flag are used together to transfer non-cyclic packages between the protocol stack and the UMAC. At initialization time, this flag is cleared.
6	Process Data 0 Out Command (HCF_PD0_OUT_CMD)  Both the HCF_PD0_OUT_CMD flag and the NCF_PD0_OUT_ACK flag are used together to transfer cyclic output data from the UMAC to the protocol stack. At initialization time, this flag may be set, depending on the data exchanged mode.
7	Process Data 0 In Acknowledge (HCF_PD0_IN_ACK)  Both the HCF_PD0_IN_ACK flag and the NCF_PD0_IN_CMD flag are used together to transfer cyclic input data from the protocol stack to the UMAC. At initialization time, this flag may be set, depending on the data exchanged mode.
8	Process Data 1 Out Command (HCF_PD1_OUT_CMD, not supported yet)  Both the HCF_PD1_OUT_CMD flag and the NCF_PD1_OUT_ACK flag are used together to transfer cyclic output data from the UMAC to the protocol stack. At initialization time, this flag may be set, depending on the data exchanged mode.
9	Process Data 1 In Acknowledge (HCF_PD1_IN_ACK, not supported yet)  Both the HCF_PD1_IN_ACK flag and the NCF_PD1_IN_CMD flag are used together to transfer cyclic input data from the protocol stack to the UMAC. At initialization time, this flag may be set, depending on the data exchanged mode.

## **Application Handshake Cells**

Although these cells are not supported yet, the following structure groups have been defined for backward compatibility as a placeholder:

## netX Communication Flags

**Host Communication Flags** 

#### **Communication Channel**

The communication channel structure is mainly dependent on the protocol firmware and COMX module. However, there are common sub-block structures which are common to all protocols.

#### **Control Block**

The control block of a dual-port memory features a Watchdog function to allow the operating system running on the netX to supervise the host application and vice versa. The control area is always present in dual-port memory. This block can also be read using the mailbox interface.

#### **Application Change of State Register**

The Application Change of State Register is a bit field. The UMAC uses this field to send commands to the communication channel. Changing flags in this register requires the UMAC to toggle the Host Change of State Command flag in the Host Communication Flags register, and then the netX protocol stack will recognize the change.

ulAp	applicationCOS – UMAC writes, netX reads															
Bit	31 30 29 11 10 9								7	6	5	4	3	2	1	0
Function			Re	serv	ed			RCX_APP_COS_DMA_ENABLE	RCX_APP_COS_DMA	RCX_APP_COS_LOCK_CONFIG_ENABLE	RCX_APP_COS_LOCK_CONFIG	RCX_APP_COS_INIT_ENABLE	RCX_APP_COS_INIT	RCX_APP_COS_BUS_ON_ENABLE	RCX_APP_COS_BUS_ON	RCX_APP_COS_APP_READY

Bit	Definition / Description
No.	
0	Application Ready (RCX_APP_COS_APP_READY, not supported yet)
0	If set, the UMAC indicates to the protocol stack that its state is Ready.
	Bus On (RCX_APP_COS_BUS_ON)
	Using the Bus On flag, the UMAC allows or disallows the firmware to open network
1	connections. This flag is used with Bus On Enable flag below. If set, the netX firmware tries
	to open network connections; if cleared, no connections are allowed, and open connections are
	closed.
	Bus On Enable (RCX_APP_COS_BUS_ON_ENABLE)
2	The Bus On Enable flag is used together with the Bus On flag above. If set, this flag enables
	the execution of the Bus On command in the netX firmware.
	Initialization (RCX_APP_COS_INIT)
	Setting the Initialization flag the UMAC forces the protocol stack to restart and evaluate the
3	configuration parameter again. All network connections are interrupted immediately
	regardless of their current state. If the database is locked, re-initializing the channel is not
	allowed.
	Initialization Enable (RCX_APP_COS_INIT_ENABLE)
4	The Initialization Enable flag is used together with the Initialization flag above. If set, this flag
	enables the execution of the Initialization command in the netX firmware.
	Lock Configuration (RCX_APP_COS_LOCK_CONFIG)
5	If set, UMAC does not allow the firmware to reconfigure the communication channel. The
3	database will be locked. The Configuration Locked flag in the channel status block shows if
	the current database has been locked.

Bit No.	Definition / Description
6	Lock Configuration Enable (RCX_APP_COS_LOCK_CONFIG_ENABLE)
	The Lock Configuration Enable flag is used together with the Lock Configuration flag
	above. If set, this flag enables the execution of the Lock Configuration command in the netX
	firmware.
7	Turn on DMA Mode (RCX_APP_COS_DMA)
	The UMAC sets this flag in order to turn on the DMA mode for the cyclic process data input
	/ output image 0 (abPd0Output and abPd0Input).
8	Turn on DMA Mode Enable (RCX_APP_COS_DMA_ENABLE)
	The DMA Enable flag is used together with the DMA flag above. If set, this flag enables the
	execution of the DMA command in the netX firmware.
9 31	Reserved, set to 0

#### **Device Watchdog Register**

The protocol stack supervises the UMAC using a Watchdog function. If the UMAC fails to copy the value from the host Watchdog location to the device Watchdog location, the protocol stack assumes that the UMAC system has a problem and interrupts all network connections immediately, regardless of their current state.

Note: x in MACRO name is replaced by Application Channel number 0 3			

#### Common Status Block

The common status block contains information fields that are common to all protocol stacks. The status block is always present in dual-port memory. This block can also be read using the mailbox interface.

#### **Communication Change of State Register**

The Communication Change of State register is a bit field. It contains information about the current operating status of the communication channel and its firmware. Every time the status changes, the netX protocol stack toggles the netX Change of State Command flag in the netX communication flags register. The UMAC then has to toggle the netX Change of State Acknowledge flag back, acknowledging the new state.

Bit No.	Definition / Description
	Ready (RCX_COMM_COS_READY)
0	The Ready flag is set as soon as the protocol stack is started properly. Then, the protocol
	stack awaits a configuration. As soon as the protocol stack is configured properly, the
	Running flag is set.
	Running (RCX_COMM_COS_RUN)
1	The Running flag is set when the protocol stack has been configured properly. Then the
	protocol stack awaits a network connection. Now, both the Ready flag and the Running flag
	are set.
	Bus On (RCX_COMM_COS_BUS_ON)
	The Bus On flag is set to indicate to the UMAC whether or not the protocol stack has the
2	permission to open network connections. If set, the protocol stack has the permission to
	communicate on the network; if cleared, the permission was denied and the protocol stack
	will not open network connections.
3	Configuration Locked (RCX_COMM_COS_CONFIG_LOCKED)
	The Configuration Locked flag is set if the communication channel firmware has locked the
	configuration database against being overwritten. Reinitializing the channel is not allowed
	in this state. To unlock the database, the application has to clear the Lock Configuration flag
	in the control block.
	Configuration New (RCX_COMM_COS_CONFIG_NEW)
4	The Configuration New flag is set by the protocol stack to indicate that a new configuration
	became available, but has not yet been activated. This flag may be set together with the
	Restart Required flag.
	Restart Required (RCX_COMM_COS_RESTART_REQUIRED)
5	The Restart Required flag is set when the channel firmware requests to be restarted. This
	flag is used together with the Restart Required Enable flag below. Restarting the channel
	firmware may become necessary if a new configuration was downloaded from the UMAC
	or if a configuration upload via the network took place.
6	Restart Required Enable (RCX_COMM_COS_RESTART_REQUIRED_ENABLE)  The Restart Required Enable flag is used together with the Restart Required flag above. If
U	
	set, this flag enables the execution of the Restart Required command in the netX firmware.  DMA Mode On (RCX_COMM_COS_DMA)
7	The protocol stack sets this flag in order to signal to the UMAC that the DMA mode is
,	turned on.
8 31	Reserved, set to 0
o J1	Reserved, set to 0

## **Communication State**

The communication state field contains current device network communication status information. Depending on the implementation, all or a subset of the definitions below is supported:

Value	Definition / Description
\$0	UNKNOWN
\$1	OFFLINE
\$2	STOP
\$3	IDLE
\$4	OPERATE

#### **Communication Channel Error**

This field holds the current error code of the communication channel. If the cause of error is resolved, the communication error field is set to zero (= RCX\_S\_OK) again. Not all of the error codes are supported in every implementation.

#### **Watchdog Timeout**

This field holds the configured Watchdog timeout value in milliseconds. The UMAC may set its Watchdog trigger interval accordingly. If the UMAC fails to copy the value from the host Watchdog location to the device Watchdog location, the protocol stack will interrupt all network connections immediately, regardless of their current state.

#### Handshake Mode

The protocol stack supports different handshake mechanisms to synchronize process data exchange with the UMAC. Depending on the configured mode, this mechanism insures data consistency over the entire data image and helps synchronize the UMAC with the network. This register holds the configured handshake mode.

Value	Definition / Description
\$0	For compatibility reasons, this value is identical to 0x04 - Buffered Host Controlled IO
\$0	Data Transfer
\$2	Buffered Device-Controlled I/O Data Transfer
\$3	Uncontrolled Mode
\$4	Buffered Host-Controlled IO Data Transfer

#### **Host Watchdog**

The protocol stack supervises the UMAC via the Watchdog function. If the UMAC fails to copy the value from the device Watchdog location to the host Watchdog location, the protocol stack assumes that the UMAC has a problem and shuts down all network connections.

#### **Error Count (All Implementations)**

This field holds the total number of errors detected since power-up or after a reset. The protocol stack counts all sorts of errors in this field regardless if they were network-related or caused internally. The counter is cleared after a power cycle, reset, or channel initialization.

#### **Error Log Indicator (All Implementations)**

Not supported yet; the error log indicator field holds the number of entries in the internal error log. The field is set to zero if all entries are read from the log.

## **Number of Input Process Data Handshake Errors**

TBD

## **Number of Output Process Data Handshake Errors**

TBD

#### **Number of Synchronization Handshake Errors**

This counter will be incremented if the device detects a "not handled synchronization indication." This field is not supported yet.

#### **Synchronization Status**

This field is reserved for future use.

#### Slave State

The Slave State field indicates whether or not the master is in cyclic data exchange to all configured slaves. If there is at least one slave missing or if the slave has a diagnostic request pending, the status

changes to FAILED. For protocols that support non-cyclic communication only, the slave state is set to OK as soon as a valid configuration is found.

Value	Definition / Description
\$0	UNDEFINED
\$1	OK. No Fault.
\$2 FAILED. At least one slave failed	
Other values are reserved	

### **Slave Error Log Indicator**

Not supported yet: the error log indicator field holds the number of entries in the internal error log. The field is set to zero if all entries are read from the log.

### **Number of Configured Slaves**

The firmware maintains a list of slaves with which the master has to open a connection. This list is derived from the configuration database created by SYCON.net. This field holds the number of configured slaves.

#### **Number of Active Slaves**

The firmware maintains a list of slaves to which the master exchanges process data. This field holds the number of active slaves. Ideally, the number of active slaves is equal to the number of configured slaves. For certain fieldbus systems, it could be possible that a slave is shown as activated, but still has a problem (i.e. a diagnostic issue).

### **Number of Faulted Slaves**

The firmware maintains a list of slaves that are missing on the network, although they may be configured, or are reporting a diagnostic issue. As long as those indications are pending and not serviced, the field holds a nonzero value. If no more diagnostic information is pending, the field is set to zero again.

Note: x in MACRO name is replaced by Application Channel number 0 3			

## **Application Channel**

The application channel is reserved for user specific implementations. An application channel is not yet supported.

# **Auto-Generated Dual-Ported Memory Map**

ACC-72EX Setup Assistant Software, designed for use with Turbo PMAC, provides some level of automation in the identification of Hilscher COMX modules by generating a memory map file, suggested M-Variable definitions for important registers, and appropriate macro names.

### **Address Converter**

The Address Converter section of the software allows conversion of offset, bit, and width parameters to PMAC memory addresses based on Hilscher documentation.

### **Memory Map Generator**

The Memory Map Generator section of the software identifies the ACC-72EX cards in a UMAC system and generates both a memory map as a text file and M-Variable definition file with proper addressing, both of which indicate the ACC-72EX-based address selection.

### Reading the Memory Map Text File

The output file from the software is a text file which can be read with any text editor software. This file includes generic information about the card.

Below is an example output file. Please see the notes in the right column for more information on specific items.

# **DPRAM DATA PROCESSING**

Since there are two processors (i.e. UMAC and netX) attempting to access data registers in Dual-Ported Memory simultaneously, several handshaking modes can be used to guarantee data consistency. Each sub-block defines the type of handshaking, if any, it requires. The ACC-72EX Setup Assistant software output file lists the type of handshaking required for each of the sub-blocks available on the COMX module.

Should handshaking not be used, collision circuitry on the gateway will, in the very least, guarantee consistency within single byte boundaries.

## **Non-Cyclic Data Exchange**

The mailbox of a communication channel or system channel has two areas that are used for non-cyclic message transfer to and from the netX.

- Send Mailbox (System / Communication Channel)
  - Packet transfer from UMAC to netX firmware
- Receive Mailbox (System / Communication Channel)

Packet transfer from netX firmware to UMAC

For a communication channel, send and receive mailbox areas are used by fieldbus protocols, providing a non-cyclic data exchange mechanism. Another use of the mailbox system is to allow access to the firmware running on the netX chip for diagnostic and identification purposes. The **send mailbox** is used to transfer cyclic data **to** the network or **to** the netX. The **receive mailbox** is used to transfer cyclic data **from** the network or **from** the netX. Modbus Plus or Ethernet TCP/IP is an example of a fieldbus protocol which utilizes a non-cyclic data exchange.

Whether or not a mailbox is used depends on the function of the firmware.

Note

Each mailbox can hold one packet at a time. netX stores packets in an internal packet queue; these packets are not retrieved by UMAC. This queue has limited space and may fill up, so new packets may be lost. To avoid these deadlock situations, it is strongly recommended to empty the mailbox frequently, even if packets are not expected by the UMAC program. Unexpected command packets should be returned to the sender with an Unknown Command in the status field; unexpected reply messages can be discarded.

### **Message or Packets**

The non-cyclic packets obtained through the netX mailbox have the following structure:

		SRMB_ultData0 SRMB_ultData20	

The size of a packet is always at least 40 bytes. Depending on the command, a packet may or may not have a payload in the data field (tData). If present, the contents of the data field are specific to the command or reply.

### Destination Queue Handler

The ulDest field identifies a task queue in the context of the netX firmware. The task queue represents the final receiver of the packet and is assigned to a protocol stack. The ulDest field has to be filled out in any case; otherwise, the netX operating system cannot route the packet.

#### Source Queue Handler

The ulSrc field identifies the sender of the packet. In the context of the netX firmware (inter-task communication), this field holds the identifier of the sending task. Usually, a UMAC program uses this field for its own handle, but it can hold any handle of the sending process. The receiving task does not evaluate this field and will pass it back unchanged to the originator of the packet.

#### Destination Identifier

The ulDestId field identifies the destination of an unsolicited packet from the netX firmware to the UMAC. It can hold any handle that helps identify the receiver. Its use is mandatory for unsolicited packets. The receiver of unsolicited packets has to register for this service (details are yet to be determined).

### Source Identifier

The ulSrcId field identifies the originator of a packet. This field is used by a UMAC program which passes a packet from an external process to an internal netX task. The ulSrcId field holds the handle of the external process. When the netX operating system returns the packet, the UMAC program can identify the packet, and returns it to the originating process. The receiving task on the netX does not evaluate this field, and passes it back unchanged. For inter-task communication, this field is not used.

### Length of Data Field

The ulLen field holds the size of the data field tData in bytes. It defines the total size of the packet's payload that follows the packet's header. Note that the size of the header is not included in ulLen. Depending on the command or reply, a data field may or may not be present in a packet. If no data field is used, the length field is set to zero.

#### Identifier

The ulId field is used to identify a specific packet among others of the same kind. That way the application or driver can match a specific reply or confirmation packet to a previous request packet. The receiving task does not change this field and passes it back to the originator of the packet. Its use is optional in most of cases, but it is mandatory for fragmented packets. Example: downloading large amounts of data that do not fit into a single packet. For fragmented packets, the identifier field is incremented by one for every new packet.

#### Status / Error Code

The ulSta field is used in response or confirmation packets. It informs the originator of the packet about success or failure of the execution of the command. The field may be also used to hold status information in a request packet. Status and error codes that may be returned in ulSta are outlined in Status and Error Code section.

#### Command / Response

The ulCmd field holds the command code or the response code. The command/response is specific to the receiving task. If a task is not able to execute certain commands, it will return the packet with an error indication. A command is always even (the least significant bit is zero). In the response packet, the command code is incremented by one indicating a confirmation to the request packet.

#### Extension

The extension field ulExt is used for controlling packets that are sent in a sequenced or fragmented manner. The extension field indicates the first, last, or a packet of a sequence. If fragmentation of packets is not required, the extension field is set to zero.

#### Routing Information

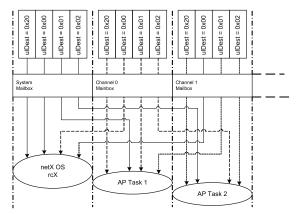

The ulRout field is used internally by the netX firmware only. It has no meaning to a driver type application and therefore is set to zero.

#### User Data Field

The tData field contains the payload of the packet. Depending on the command or reply, a packet may or may not have a data field. The length of the data field is given in the ulLen field.

### **About System and Channel Mailbox**

The preferred way to address the netX operating system, rcX, is through the system mailbox. The preferred way to address a protocol stack is through its channel mailbox. All mailboxes, however, have a mechanism to route packets to any communication channel or the system channel. Therefore, the destination identifier ulDest in a packet header has to be filled in according to the targeted receiver (see the following image).

The above figure and table below illustrate the use of the destination identifier ulDest.

Value	Definition / Description
\$0	Packet is passed to the netX operating system rcX
\$1	Packet is passed to communication channel 0
\$2	Packet is passed to communication channel 1
\$3	Packet is passed to communication channel 2
\$4	Packet is passed to communication channel 3
\$20	Packet is passed to 'local' communication or system channel
Else	Reserved, Do Not Use

In regards to the channel identifier 0x00000020 (= Channel Token), the Channel Token is valid for any mailbox. That way, the UMAC program uses the same identifier for all packets without actually knowing which mailbox or communication channel is applied. The packet stays "local." The system mailbox is a little bit different because it is used to communicate to the netX operating system, rcX. The rcX has its own range of valid command codes and differs from the communication channels.

If there is a reply packet, the netX operating system returns it to the same mailbox that the request packet went through. Consequently, the UMAC program has to return its reply packet to the mailbox from which the request was received.

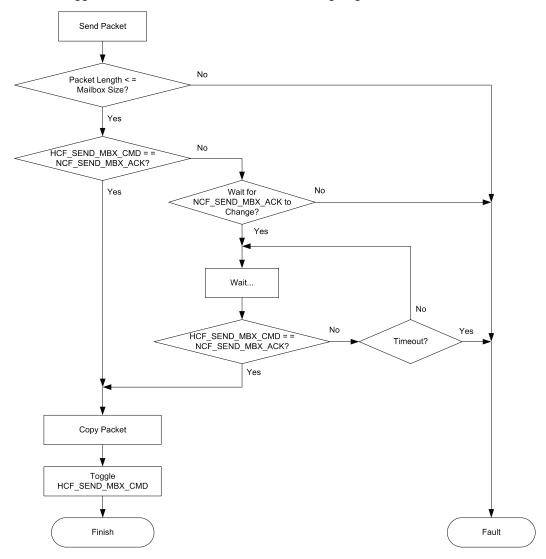

### **Command and Acknowledge**

To ensure data consistency over the content of a mailbox, the firmware uses a pair of flags, each for one direction. Engaging these flags gives access rights alternating to either the user application or the netX firmware. If both UMAC and netX firmware were to access the mailbox at the same time, it may cause loss of data or inconsistency.

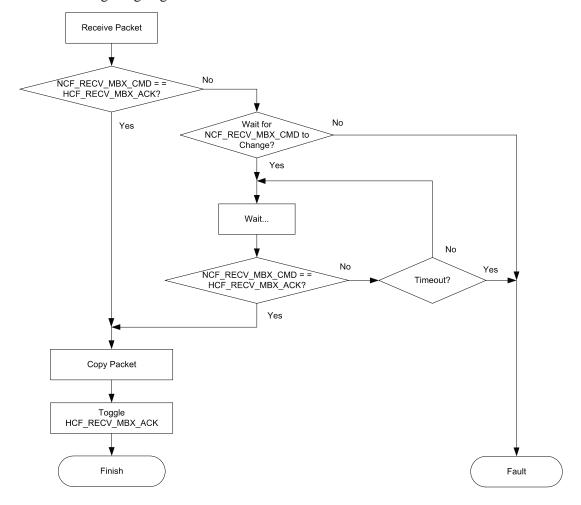

As a general rule, if both flags have the same value (both are set or both are cleared), the process which intends to write has access rights. If they have a different value, the process which intends to read has access rights. The following table illustrates this mechanism.

Send Mailbox	CMD Flag	ACK Flag	
UMAC Has Write Access	0	0	netX Has NO Read Access
UMAC Has NO Write Access	0	1	netX Has Read Access
UMAC Has NO Write Access	1	0	netX Has Read Access
UMAC Has Write Access	1	1	netX Has NO Read Access
Receive Mailbox	CMD Flag	ACK Flag	
UMAC Has NO Read Access	0	0	netX Has Write Access
UMAC Has Read Access	0	1	netX Has NO Write Access
UMAC Has Read Access	1	0	netX Has NO Write Access
UMAC Has NO Read Access	1	1	netX Has Write Access

The following flowcharts illustrate how the transfer mechanism (send and receive packets) works. In order to send a packet, first the function checks if the size of the packet to be sent exceeds the mailbox size. If both the Host Send Mailbox Command flag and the netX Send Mailbox Acknowledge flag are either set or cleared, the host application is allowed to send the packet. When copying data to the mailbox is done, the host toggles the Host Send Mailbox Command flag to give control to the netX firmware.

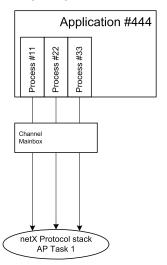

In order to receive a packet, the function checks if the netX Receive Mailbox Command flag and the Host Receive Mailbox Acknowledge flag have different values. If so, the host application is allowed to access the mailbox. When the host is done copying data from the mailbox, the host toggles the Host Receive Mailbox Acknowledge flag to give control to the netX firmware.

### Using ulSrc and ulSrcId

Generally, a netX protocol stack is addressed through its communication channel mailbox. The example below shows how a host application addresses a protocol stack running in the context of the netX chip. The application is identified by a number (#444 in this example). The application consists of three processes numbered #11, #22 and #33. These processes communicate through the channel mailbox to the AP task of a protocol stack. See the following image:

#### Example:

This example applies to command messages imitated by a process in the context of the host application identified by number #444. If the process #22 sends a packet through the channel mailbox to the AP task, the packet header has to be filled in as follows:

```
Destination Queue Handler ulDest = 32; /* 0x20: local channel mailbox */
Source Queue Handler ulSrc = 444; /* host application */
Destination Identifier ulDestId= 0; /* not used */
Source Identifier ulSrcId = 22; /* process number */
```

For packets through the channel mailbox, the application uses 32 = 0x20, Channel Token) for the destination queue handler ulDest. The source queue handler ulSrc and the source identifier ulSrcId are used to identify the originator of a packet. The destination identifier ulDestId can be used to address certain resources in the protocol stack. It is not used in this example. The source queue handler ulSrc must have an entry, and therefore its use is mandatory; the use of ulSrcId is optional.

The netX operating system passes the request packet to the protocol stack's AP task. The protocol stack then builds a reply to the packet and returns it to the mailbox. The application has to make sure that the packet finds its way back to the originator (process #22 in the example).

### **How to Route rcX Packets**

To route an rcX packet, the source identifier ulSrcId and the source queues handler ulSrc in the packet header hold the identification of the originating process. The router saves the original handle from ulSrcId and ulSrc. It uses handles of its own choice for ulSrcId and ulSrc before it sends the packet to the receiving process. That way, the router can identify the corresponding reply packet and match the handle from that packet with the one stored earlier. Lastly, the router replaces its handles with the original handles and returns the packet to the originating process.

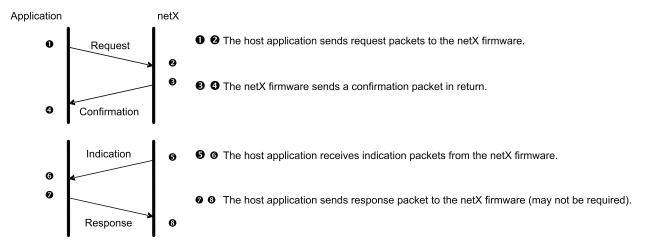

### **Client/Server Mechanism**

Depending on the message destination or packet protocol, the UMAC program or application can act as a client or a server. This section explains both methods, but selection of the appropriate method depends on the destination or protocol option.

## **Application as Client**

The host application may send request packets to the netX firmware at any time (transition  $1 \Rightarrow 2$ ). Depending on the protocol stack running on the netX, parallel packets are not permitted (see protocol specific manual for details). The netX firmware sends a confirmation packet in return, signaling success or failure (transition  $3 \Rightarrow 4$ ) while processing the request.

The host application has to register with the netX firmware in order to receive indication packets (transition  $5 \Rightarrow 6$ ). Depending on the protocol stack, this is done either implicitly (if application opens a TCP/UDP socket) or explicitly (if application wants to receive unsolicited DPV1 packets). Details on when and how to register for certain events is described in the protocol specific manual. Depending on the command code of the indication packet, a response packet to the netX firmware may or may not be required (transition  $7 \Rightarrow 8$ ).

### Application as Server

The host application has to register with the netX firmware in order to receive indication packets (unsolicited telegrams). Depending on the protocol stack, this is done either implicitly (if the application opens a TCP/UDP socket) or explicitly (if the application wants to receive unsolicited DPV1 packets). Details on when and how to register for certain events is described in the protocol-specific manual.

When an appropriate event occurs and the host application is registered to receive such a notification, the netX firmware passes an indication packet through the mailbox (transition  $1 \Rightarrow 2$ ). The host application is expected to send a response packet back to the netX firmware (transition  $3 \Rightarrow 4$ ).

## Input/Output Data Image

Hilscher products support two methods for accessing the Input/Output Data Image:

- DPM (Dual-Ported Memory) Mode
- DMA (Direct Memory Access) Mode

However, the modules used in ACC-72EX only support the DPM mode, and only Hilscher PCI cards support DMA mode.

In DPM Mode, handshaking between the UMAC (host) program and netX is required for any data transfer.

#### **Process Data Handshake Modes**

The netX firmware allows controlling the transfer of data independently for inputs and outputs. Therefore, the process data handshake is carried out individually for input and output image. The handshake cells are located in the handshake channel.

Mode	Controlled by	Consistency	Supported by
Buffered	Host (Application/Driver)	Yes	Master & Slave Firmware

### Buffered, Host Controlled Mode

The Buffered data transfer mode can be used for both master- and slave- type devices. In "buffered" mode, the protocol stack handles the exchange of data between internal buffers and the process data images in the dual-port memory with the application via a handshake mechanism. Once copied from/into the input/output area, the host application gives control over the dual-port memory to the protocol stack. Control is given back to the host application when the protocol stack has finished copying, and so on.

The network cycle and the task cycle of the host application are not synchronized, but are consistent.

Note

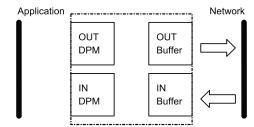

If the host application is faster than the network cycle, it might be possible that data in the output buffers is overwritten without ever being sent to the network. As for the other direction, the host application may read the same input values over several read cycles.

If the host application is slower than the network cycle, the protocol stack overwrites the input buffer with new data received from the network, which were never received by the host application. The output data on the network will be the same over several network cycles.

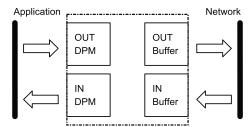

For each valid bus cycle, the protocol stack updates the process data in the internal input buffer. When the application toggles the appropriate input handshake bit, the protocol stack copies the data from the internal IN buffer into the input data image of the dual-port memory. Now the application can copy data from the dual-port memory and then give control back to the protocol stack by toggling the appropriate input handshake bit. When the application/driver toggles the output handshake bit, the protocol stack copies the data from the output data image of the dual-port memory into the internal buffer. From there, the data is transferred to the network. The protocol stack toggles the appropriate handshake bits back, indicating to the application that the transfer is finished and a new data exchange cycle may start. This mode guarantees data consistency over both the input and output areas.

### **Step-by-Step Procedure**

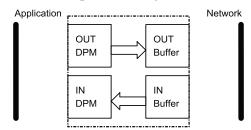

**Step 1** The protocol stack sends data from the internal OUT buffer to the network and receives data from the network in the internal IN buffer.

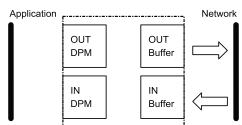

Step 2 The application has control over the dual-port memory and exchanges data with the input and output data images in the dual-port memory. The application then toggles the handshake bits, giving control over the dual-port memory to the protocol stack

Step 3 The protocol stack copies the content of the output data image into the internal OUT buffer, and from the IN buffer to the input data image.

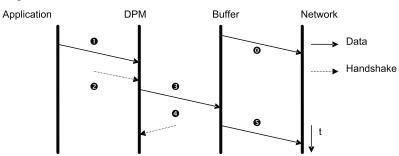

Step 4 The protocol stack toggles the handshake bits, giving control back to the application. Now, the protocol stack uses the new output data image from the OUT buffer to send it to the network, and receives data into the internal IN buffer, and then the cycle repeats.

#### **Time-Related View**

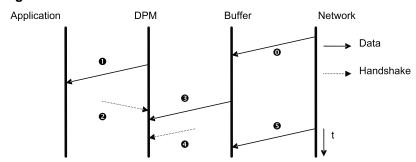

The following figure shows the procedure in a time-related view.

### **Output Data Exchange**

- 1. The protocol stack constantly transmits data from the buffer to the network.
- 2. The application has control over the dual-port memory and can copy data to the output data image.
- 3. The application then toggles the handshake bits, giving control over the dual-port memory to the protocol stack.
- 4. The protocol stack copies the content of the output data image into the internal OUT buffer.
- 5. The protocol stack toggles the handshake bits, giving control back to the application.
- 6. Once updated, the protocol stack uses the new data from the internal buffer and sends it to the network. The cycle repeats with step 1.

### **Input Data Exchange**

- 1. The protocol stack constantly receives data from the network into the buffer.
- 2. The application has control over the dual-port memory input data image and exchanges data with the input data image in the dual-port memory.
- 3. The application then toggles the handshake bits, giving control over the dual-port memory to the netX protocol stack.
- 4. The protocol stack copies the latest content of the internal IN buffer to the input data image of the dual-port memory.
- 5. The protocol stack then toggles the handshake bits, giving control back to the application.
- 1. The protocol stack receives data from the network into the buffer (i.e. the cycle starts over with the first step).

Note

In case of a network fault (e.g. disconnected network cable), a slave firmware keeps the last state of the input data image. As soon as the firmware detects the network fault, it clears the Communicating flag in the netX communication flags. The input data should then no longer be evaluated.

# **Start / Stop Communication**

### **Controlled or Automatic Start**

The firmware has the option to start network communication after power up automatically. Whether or not the network communication will be started automatically is configurable. However, the preferred option is called "Controlled Start of Communication." This option forces the channel firmware to wait for the host application to allow network connection being opened by setting the Bus On flag in the Application Change of State register in the channel's control block. Consequently, the protocol stack will not allow the opening of network connections and does not exchange any cyclic process data until the Bus On flag is set.

The second option enables the channel firmware to open network connections automatically without interacting with the host application. It is called "Automatic Start of Communication." This method is not recommended because the host application has no control over the network connection status. In this case, the Bus On flag is not evaluated.

Note

The Controlled Start of communication is the default method used for the default dual-port memory layout.

# **Start / Stop Communication through Dual-Port Memory**

### (Re-)Start Communication

To allow the protocol stack to open connections or to allow connections to be opened, the application sets the Bus On flag in the Application Change of State register in the channel's control block. When firmware has established a cyclic connection to at least one network mode, the channel firmware sets the Communicating flag in the netX Communication Flags register.

### **Stop Communication**

To force the channel firmware to disable all network connections, the host application clears the Bus On flag in the "Application Change of State" register in the channel's control block. The firmware then closes all open network connections. A slave protocol stack would reject attempts to reopen a connection until the application allows opening network connections again (Bus On flag is set). When all connections are closed, the channel firmware clears the Communicating flag in the netX Communication Flags register.

### **Reset Command**

### **System Reset vs. Channel Initialization**

There are several methods to restart the netX firmware. The first is called "System Reset." The System Reset affects the netX operating system, rcX, and the protocol stacks. It forces the chip to immediately stop all running protocol stacks and the rcX itself. During the system reset, the netX is performing an internal memory check and other functions to insure the integrity of the netX chip itself.

The Channel Initialization, as the second method, affects a communication channel only. The channel firmware then reads and evaluates the configuration settings (or SYCON.net database, if available) again. The operating system is not affected. There are no particular tests performed during a channel initialization.

A third method to reset the netX chip is called Boot Start. No firmware is started when a System Reset is executed with the boot start flag set. The netX remains in boot loader mode.

Note

A System Reset, Channel Initialization, and boot start may cause all network connection to be interrupted immediately, regardless of their current state.

During a HW-Reset and the time when the 2nd stage loader starts the Firmware, the content of the dual port memory can be 0xFFFF or 0x0BAD for a short period of time.

When used with Turbo PMAC2 CPU, it is necessary to reset the COMX module for proper functionality after initial power up, cycle power, or a \$\$\$ or \$\$\$\*\*\* command.

### **Resetting netX through Dual-Port Memory**

To reset the entire netX firmware, the host application has to set the HSF\_RESET bit in the bHostSysFlags register to perform a system-wide reset and respectively the APP\_COS\_INIT flag for a channel initialization in the ulApplicationCOS variable in the control block of the channel. The system reset and the channel initialization are handled differently by the firmware (see above).

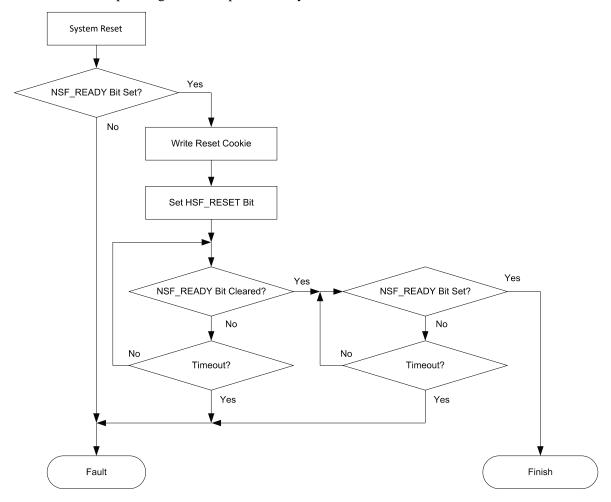

#### System Reset

To reset the netX operating system rcX and all communication channels, the host application has to write \$55AA55AA (System Reset Cookie) to the ulSystemCommandCOS variable in the system control block. Then, the HSF\_RESET flag in bHostSysFlags has to be set. If the operating system does not find \$55AA55AA in the ulSystemCommandCOS variable, the reset command will be ignored.

The operating system clears the NSF\_READY flag in bNetxFlags in the system handshake register, indicating that the system-wide reset is in progress. During the reset, all communication channel tasks are stopped, regardless of their current state. The rcX operating system flushes the entire dual-port memory and writes all memory locations to zero. After the reset, if rcX is finished without complications, and all protocol stacks are started properly, the NSF\_READY flag is set again. Otherwise, the NSF\_ERROR flag in bNetxFlags in the system handshake register is set, and an error code is written in ulSystemError in the system status block (see page 46), which helps identify possible problems.

Value	Definition/Description	
\$55AA55AA	System reset cookie	

The image below illustrates the steps the host application has to perform in order to execute a systemwide reset on the netX chip through the dual-port memory.

### **Timing**

The duration of the reset outlined above depends on the firmware. Typically, the NSF\_READY flag is cleared within around 100 - 500 ms after the HSF\_RESET Flag was set. When cleared, the NSF\_READY bit will be set again after around 0.5 - 5 s. Generally, the reset should not take more than 6 seconds.

### **Channel Initialization**

In order to force the protocol stack to restart and evaluate the configuration parameter again, the application can set the APP\_COS\_INIT flag in the ulApplicationCOS register in the control block or send a reset packet to the communication channel. All open network connections are interrupted immediately, regardless of their current state. Reinitializing the channel is not allowed if the database is locked.

Changing flags in the ulApplicationCOS register requires the application also to toggle the host change of state command flag in the host communication flags register. Only then, the netX protocol stack recognizes the reset command.

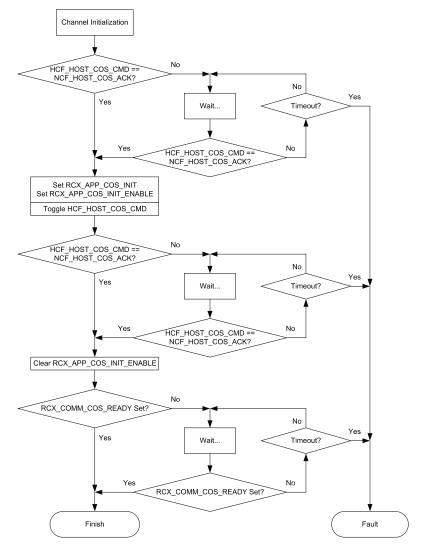

#### Below is the sequence:

```
CCO_RCX_APP_COS_INIT=1
CCO_RCX_APP_COS_INIT_ENABLE=1
HCCCO_HCF_HOST_COS_CMD=1
```

During channel initialization, the RCX\_COMM\_COS\_READY flag and the RCX\_COMM\_COS\_RUN flag are cleared together. The RCX\_COMM\_COS\_READY flag stays cleared for at least 20 ms before it is set again, indicating that the initialization has finished. The RCX\_COMM\_COS\_RUN flag is set if a valid configuration was found. Otherwise, it stays cleared.

After the initialization process has finished, the protocol stack checks ulApplicationCOS register. If the RCX\_APP\_COS\_BUS\_ON flag and the RCX\_APP\_COS\_BUS\_ON\_ENABLE flags are set, network communication will be restored automatically. The same is true for the Lock Configuration feature (RCX\_APP\_COS\_LOCK\_CONFIG / RCX\_APP\_COS\_LOCK\_CONFIG\_ENABLE) and the DMA data transfer mechanism (RCX\_APP\_COS\_DMA / RCX\_APP\_COS\_DMA\_ENABLE).

The image below illustrates the steps the host application has to perform in order to execute a channel initialization on the protocol stack through the dual-port memory.

## **System Reset through Packets**

The netX chip can be reset using a packet instead of the dual-port memory. The request packet is passed through the system mailbox. All open network connections are interrupted immediately, regardless of their current state. Reinitializing the channel is not allowed if the database is locked.

For detailed information about reset message settings, please see Hilscher documentation.

## **SOFTWARE SETUP**

ACC-72EX supports multiple protocols, and setting up each protocol can be a bit different, as described in the protocol specific documentation provided by Hilscher. In this section, most of the generic steps are covered with the help of examples and screenshots.

## **Required Software Packages**

Two software packages are required for setting up ACC-72EX:

- 1. SYCON.NET (V1.0310.x.x or newer), available through Hilscher's website.
  - a. If using newer ACC-72Ex modules, V1.0500.230227.42617 is required.
- 2. ACC-72EX Setup Assistant Software.

Both software packages have to be installed on the PC used for initial setup of the system and commissioning of the machine. Notice that neither of these software packages is required after the initial setup and the unit can work as a standalone setup.

## SyCon.NET Software Setup

SYCON.net is a tool for the configuration of Fieldbus and Real-Time Ethernet systems. It is based on the standardized FDT / DTM technology. Online diagnostic indicators and auto-scan function for the reading of network participants assist in the commissioning of the network. SYCON.NET is provided with the gateway module under license from Hilscher Corporation.

As of May 2023, the Profibus Slave and DeviceNet Slave options have changed slightly due to a change in the underlying module, from the COMX10 module to the COMX52 module. Setup and configuration are nearly identical, though users may require a newer version of the Sycon.Net software to support this. Version V1.0500.230227.42617 of the Sycon.Net software is available from the Knowledge Base on Hilscher's website and has been tested as compatible.

Where setup varies, new screenshots and descriptions have been provided below.

With the power off, plug the ACC-72EX into the UBUS backplane and turn on the power to the UMAC rack. Connect the diagnostic port to a USB port on the PC using a micro-USB type cable. Launch the SYCON.NET software on the PC.

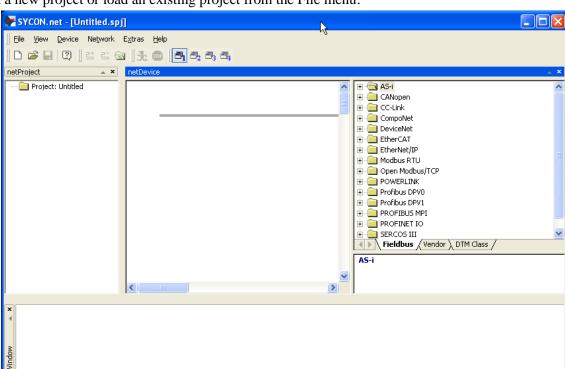

Enter the password:

Software setup 72

SYCON.net / netDevice /

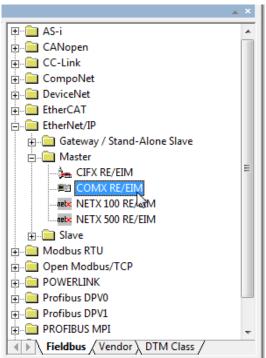

Start a new project or load an existing project from the File menu:

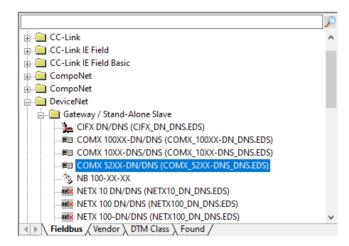

Select the COMX module to which the USB is connected from the Fieldbus protocol list. In this example, an EtherNet/IP module has been selected:

Administrator

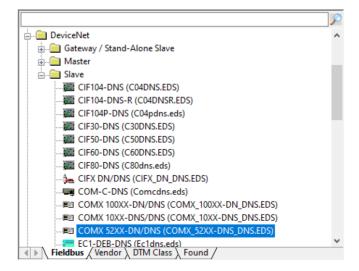

NUM

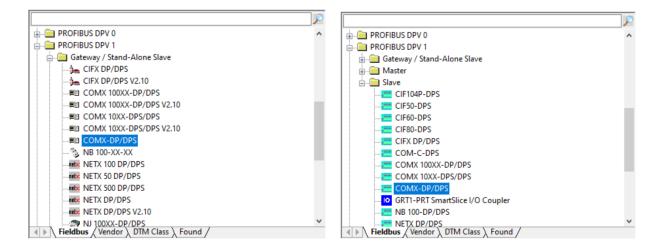

If using the COMX52 module as a Stand-Alone DeviceNet Slave, select that item from the "Gateway / Stand-Alone Slave" folder.

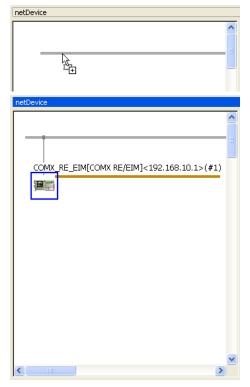

If using the COMX52 module as a slave device (and another Hilscher module as a master device), select that item from the "Slave" folder.

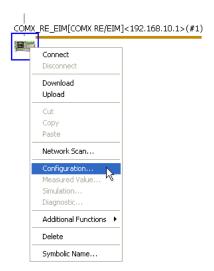

For Profibus, there is no option for a "COMX-52" module in either the "Gateway / Stand-Alone Slave" or "Slave" folders, so instead select "COMX-DP/DPS" from the appropriate location if using this module.

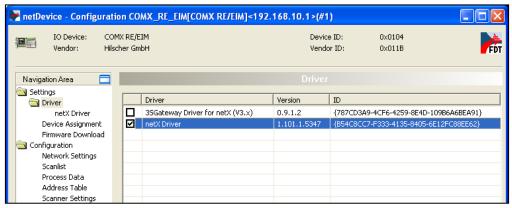

Drag and drop the module onto the BusLine in the netDevice window (notice that the module can only be inserted on the BusLine).

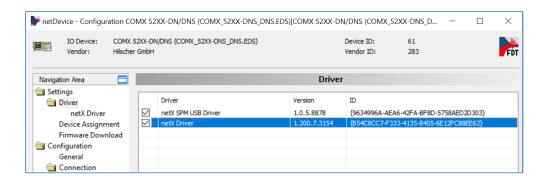

Establish USB communication to the COMX gateway by right-clicking on the device icon and selecting "Configuration...":

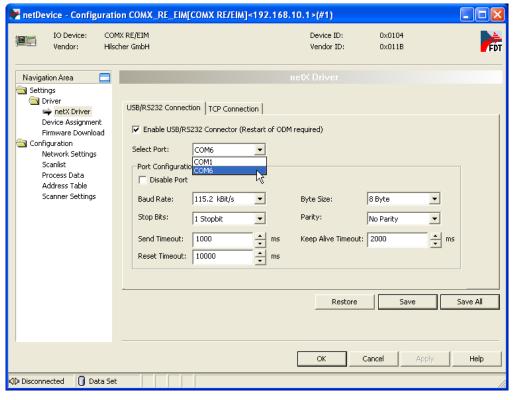

In the netDevice Configuration window, select the Driver folder under Settings folder in the NavigationArea, check the checkmark box for netX Driver on the driver list, and click Apply:

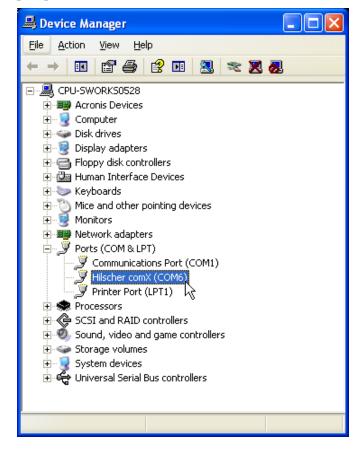

If a "netX SPM USB Driver" is also available, select it, too.

Select the netXDriver node under the Driver folder in the Navigation Area and select the port resembling the USB connection to the COMX module. Click Save and Apply (just click OK if Apply is grayed out).

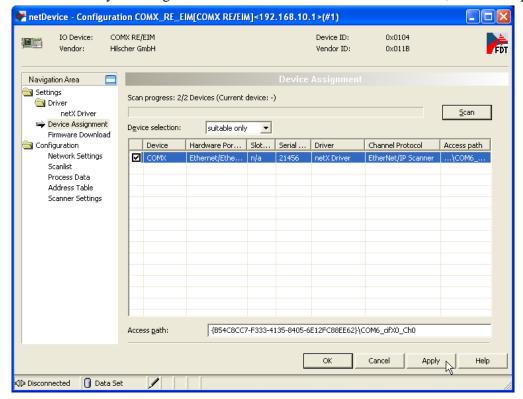

Check Windows Device Manager in order to identify which COM port provides the connection to the Hilscher COMX module.

Note

Click Device Assignment under the Driver folder in the Navigation Area. Assign the netX Driver to the detected COMX module by checking the checkmark box next to the detected device, and click Apply.

F

Note

When used with Turbo PMAC, the reset line is released too fast for some Hilscher COMX modules, which puts them in a boot mode. This can prevent the device from being detected by Sycon.NET software. Make sure the device receives a system-wide reset using the PMAC suggested M-Variables ulSystemCommandCOS and HSF\_RESET registers as shown here.

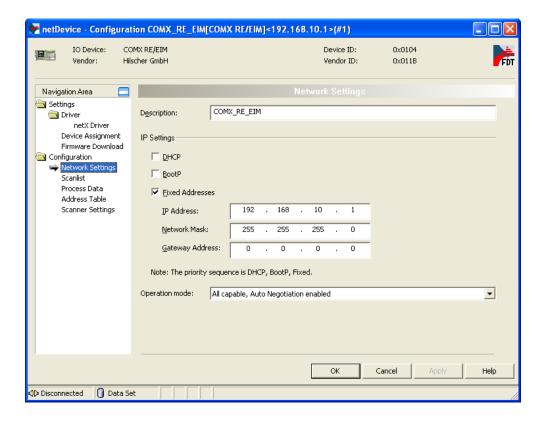

SCtrl\_ulSystemCommandCOS=\$55AA55AA

HCSC\_HSF\_RESET=1

Note that ACC-72EX Setup Assistant software automatically resets the cards if it cannot detect the identification cookie.

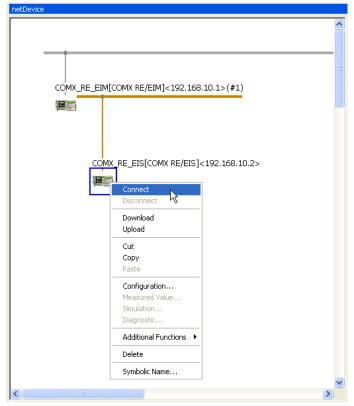

The rest of the steps are protocol/module dependent, and it is strongly recommended to follow the directions for these modules in Hilscher documentation available through their website. The current example will be continued with specifics to EtherNet/IP Scanner/Adapter setup.

Now that the COMX driver for communication between the PC and COMX module using the diagnostic port has been set up, go through protocol specific setup parameters under the Configuration folder in the Navigation Area.

After finishing modifying the settings for the device, press the OK button.

Back in the netDevice tree, right click on the device icon, and select Connect (as shown below).

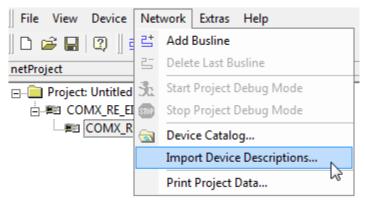

Once connected, right click on the device icon one more time and select Download (as shown below). This will download all the configurations from PC to COMX module.

Once the configuration is downloaded to the COMX module, make sure to save the SYCON.net project for later use.

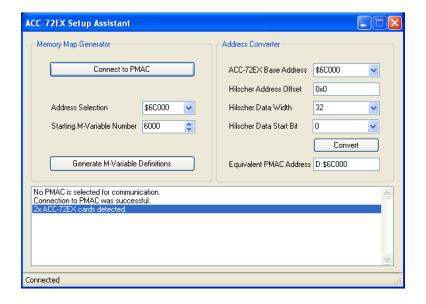

The Hilscher slave module (COMX\_RE\_IES) above was dragged and dropped from the fieldbus protocol list. Third party slave modules can be added to that list by going to "Import Device Descriptions..." in the Network tab:

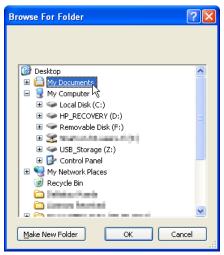

See Appendix C for an example setup using an ACC-72EX Ethernet IP slave with a third party Ethernet IP master PLC controller.

# **ACC-72EX Setup Assistant**

The next step is to generate the memory map and suggested M-Variables for the Hilscher module. Run the ACC-72EX Setup Assistant. In the Memory Map Generator groupbox, click the Connect to PMAC button, and select the UMAC where the ACC-72EX is installed. Once connected, the software will detect any available ACC-72EX(s) in the rack and list it based upon the base address(es).

Select the starting number for M-Variable assignment, and click the "Generate M-Variable Definitions" button. The program asks for a folder location to save the M-Variable definition and memory map files.

This will generate three files which are named based upon the ACC-72EX base address.

The M-variable definition and its header file can be used in writing PLCs and motion programs in PMAC. The memory map file is useful for identifying the process data image locations.

# **Turbo PMAC Setup for Using ACC-72EX**

All interactions between PMAC and ACC-72EX occur through M-variables. Most of the important registers which are required are mapped in the suggested M-Variable definition files generated by ACC-72EX Setup Assistant software. The generated files can be included in the header section of the project files in PEWIN32PRO2.

Note

If multiple ACC-72EX cards are in the same UMAC rack, the M-variable macro names will be identical for both files, despite the file name difference based upon the ACC-72EX base address. Make sure to add a prefix or suffix to the macro names both in the header file and definition file in order to distinguish the proper macro names for different ACC-72EXs. Note that no macro name should be longer than 32 characters.

There are multiple steps in getting the COMX module working with the network/fieldbus. Some of these steps are protocol-specific, and it is recommended to follow the requirements based upon each protocol manual provided by Hilscher.

#### **Initialization PLC**

Recall that ACC-72EX requires a reset after each power up, power cycle, \$\$\$ (reset), or \$\$\$\*\*\* (factory default reset). This can be achieved with a startup (or initialization) PLC. Example:

```
CLOSE
END GAT
DEL GAT
#include "M-VariableDefinition $6C000.pmc"
#include "M-VariableDefinition $74000.pmc"
#define CommErrorFlag P1
OPEN PLC 1 CLEAR
DISABLE PLC 2..31
                                               // Disable all other tasks
SCtrl ulSystemCommandCOS=$55AA55AA
                                               // Reset token for MASTER Unit
HCSC HSF RESET=1
                                              // Reset bit, token required for reset to complete
S SCtrl ulSystemCommandCOS=$55AA55AA
                                              // Reset token for SLAVE Unit
S HCSC HSF RESET=1
                                               // Reset bit, token required for reset to complete
CommErrorFlag=0
timer = 1000 msec
                                               // Reset Time-out Timer
WHILE (CommErrorFlag=0 AND HCSC NSF READY=0) // Wait for reset to complete
       IF (timer<0)</pre>
                                               // Check for reset timeout
               CommErrorFlag = 1
       ENDIF
ENDWHILE
                                                              11
IF (CommErrorFlag=0)
       WHILE (CCO RCX COMM COS RUN=0 OR S CCO RCX COMM COS RUN=0)
                                                                      // wait for comm tasks to
                                                                      \ensuremath{//} start on COMX modules
                       HCCC0 HCF NETX COS ACK = HCCC0 HCF NETX COS ACK ^{\circ} 1
                       // Toggle Communication Channel 0's Change of State Acknowledge bit in
                       // order to read the CCO RCX COMM COS RUN which is a part of Communication
                       // Channel 0 State Register
                       S HCCCO HCF NETX COS ACK = S HCCCO HCF NETX COS ACK ^ 1
       ENDWHILE
       ENABLE PLC 28
       ENABLE PLC 10
       ENABLE PLC 11
ENDIF
DISABLE PLC 1
CLOSE
```

## **Watchdog Function**

The host Watchdog and the device Watchdog cells in the control block of each of the communication channels allow the operating system running on the netX to supervise the host or UMAC application and vice versa. There is no Watchdog function for the system block or for the handshake channel. The Watchdog for the channels is located in the control block of the status block of each communication channel.

The netX firmware reads the contents of the device Watchdog cell, increments the value by one, and copies it back into the host Watchdog location. Then, the application has to copy the new value from the host Watchdog location into the device Watchdog location. Copying the host Watchdog cell to the device Watchdog cell has to happen in the configured Watchdog time. When the overflow occurs, the firmware starts over and "1" appears in the host Watchdog cell. A zero turns off the Watchdog and therefore never appears in the host Watchdog cell in the regular process.

The minimum Watchdog time is 20 ms. The application can start the Watchdog function by copying any value unequal to zero into device Watchdog cell. A zero in the device Watchdog location stops the Watchdog function. The Watchdog timeout is configurable in SYCON.net and can be downloaded to the netX firmware.

If the application fails to copy the value from the host Watchdog location to the device Watchdog location within the configured Watchdog time, the protocol stack will interrupt all network connections immediately, regardless of their current state. If the Watchdog tripped, then power cycling, channel reset, or channel initialization will allow the communication channel to open network connections again.

Here is sample code for copying the host Watchdog location to the device Watchdog location:

# **Enabling the Communication Bus**

Using the Bus On flag (CCx\_RCX\_APP\_COS\_BUS\_ON, where x is the communication channel number), the host or UMAC application allows or disallows the netX firmware to open network connections. This flag is used together with the Bus On Enable flag

(CCx\_RCX\_APP\_COS\_BUS\_ON\_ENABLE, where x is the communication channel number). If set, the netX firmware tries to open network connections; if cleared, no connections are allowed, and open connections are closed. If the Bus On Enable flag is set, it enables the execution of the Bus On command in the netX firmware:

# **Locating the Input/Output Data Image in PMAC**

Although the ACC-72EX Setup Assistant software defines M-Variables for accessing setup registers and flags in COMX modules, it does not assign any M-Variables for input/output data images. However, starting address and size of each input/output processed data image in's PMAC memory addressing format are calculated and included as a part of the memory map file that is generated. The following is an example from an EtherNet/IP option. The highlighted sections show the addressing for the processed data images:

```
+ Block 2:

       Handshake Bit:
```

Depending on the protocol, users might be interested in:

- Processed Data Images
- High Priority Data Images
- Mailboxes

Also listed in the memory map are starting address, size of each of these memory blocks, handshake method, and flag.

# Reading/Writing from/to Input/Output Data Images

There are two methods for accessing processed data images:

1. Direct M-Variable definition to each register

This method is useful if the number of I/O data variables is small enough

2. Indirect M-Variable access

This method is mostly used if the number of I/O data count is greater than a comfortable level which can be handled by the direct M-Variable definition method. Refer to the Turbo PMAC Users Manual for detailed information on how to utilize the indirect addressing method.

This example demonstrates a 16-bit integer register transfer. Notice that only the first 16-bit portion of the integer in P200 will be transferred.

```

                                                     // Making sure the ACK flag matches the CMD
                                                     // flag before writing the value to the
                                                     // output data image register
       P200=P200+1
       Master OutputData1 = P200
                                                     // Copy the value to register
       HCCCO HCF PDO OUT CMD = HCCCO HCF PDO OUT CMD^1
                                                            // Toggle the CMD flag (^: XOR)
ENDIF
CLOSE
```

In a similar approach the data can be read from an input data image:

Notice that depending on M-Variable definition, different types of data formats can be transferred over the DPR and network:

# **Power PMAC Setup for Using ACC-72EX**

Power PMAC has full support for ACC-72EX and all its fieldbus communication variations. Due to built-in data structures for accessing ACC-72EX dual ported RAM from Power PMAC, no additional software is required for memory mapping and/or identification in comparison to Turbo PMAC.

This section of the manual covers Power PMAC's built in data structures for ACC-72EX in addition to providing examples for header files, start-up and handshaking PLCs.

## ACC72EX[i]. Non-Saved Data Structures

All of the interactions with ACC-72EX can be achieved through data structures defined specifically for ACC-72EX in Power PMAC firmware. The following structures allow access to the DPRAM in bit, byte, 2-byte and 4-byte wide access modes. The bit-wise read and write is only supported through Acc72EX[i].Udata16[j] data structure.

## Acc72EX[i].Data8[j]

Description: Dual Ported RAM "unsigned 8-bit integer" data array element

Range:  $0 ... 2^{8}-1$ 

Units: address dependent

Power-on default: address dependent

**Acc72Ex**[*i*].**Data8**[*j*] is the "*j*th" unsigned 8-bit integer data array element in the **Acc72EX**[*i*] dual-ported RAM. Each of these elements occupies one byte in the DPRAM, and is located starting at *j* addresses past the beginning of the buffer (which is located at the address in **Acc72EX**[*i*].a). This array is defined based upon the Hilscher ComX memory map.

Index values *j* in the square brackets can be integer constants in the range 0 to 524,287, or local L-variables. No expressions or non-integer constants are permitted. The size of the DPRAM is dependent on the ACC-72EX communication option and installed Hilscher ComX module.

Acc72Ex[i].Data8[j] is located in the same registers as Acc72Ex[i].Idata16[j/2], Acc72Ex[i].Udata16[j/2], Acc72Ex[i].Idata32[j/4], Acc72Ex[i].Idata32[j/4] and Acc72Ex[i].Udata32[j/4]. It is the user's responsibility to prevent possible multiple uses of the same register.

In C, this element should be accessed through the C functions ACC72EX\_GetData8 and ACC72EX\_SetData8 described later in this manual.

#### Acc72EX[i].Idata16[i]

Description: Dual Ported RAM "signed 16-bit integer" data array element

Range:  $-2^{15} ... 2^{15}-1$ 

Units: address dependent

Power-on default: address dependent

**Acc72Ex**[*i*].**Idata16**[*j*] is the "*j*th" signed 16-bit integer data array element in the **Acc72EX**[*i*] dual-ported RAM. Each of these elements occupies two bytes in the DPRAM, and is located starting at 2\**j* addresses past the beginning of the buffer (which is located at the address in **Acc72EX**[*i*].a). This array is defined based upon the Hilscher ComX memory map.

Index values j in the square brackets can be integer constants in the range 0 to 262,143, or local L-variables. No expressions or non-integer constants are permitted. The size of the DPRAM is dependent on the ACC-72EX communication option and installed Hilscher ComX module.

Acc72Ex[i].Idata16[j] is located in the same registers as Acc72Ex[i].Data8[2\*j] to Acc72Ex[i].Data8[2\*j+1], Acc72Ex[i].Udata16[j], Acc72Ex[i].Idata32[j/2] and Acc72Ex[i].Udata32[j/2]. It is the user's responsibility to prevent possible multiple uses of the same register.

In C, this element should be accessed through the C functions ACC72EX\_GetIdata16 and ACC72EX\_SetIdata16 described later in this manual.

### Acc72EX[i].Udata16[j]

Description: Dual Ported RAM "unsigned 16-bit integer" data array element

Range:  $0 ... 2^{16}-1$ 

Units: address dependent

Power-on default: address dependent

**Acc72Ex**[*i*].**Udata16**[*j*] is the "*j*th" unsigned 16-bit integer data array element in the **Acc72EX**[*i*] dual-ported RAM. Each of these elements occupies two bytes in the DPRAM, and is located starting at **2**\**j* addresses past the beginning of the buffer (which is located at the address in **Acc72EX**[*i*].a). This array is defined based upon the Hilscher ComX memory map.

Index values *j* in the square brackets can be integer constants in the range 0 to 262,143, or local L-variables. No expressions or non-integer constants are permitted. The size of the DPRAM is dependent on the ACC-72EX communication option and installed Hilscher ComX module.

Acc72Ex[i].Udata16[j] is located in the same registers as Acc72Ex[i].Data8[2\*j] to Acc72Ex[i].Data8[2\*j+1], Acc72Ex[i].Idata16[j], Acc72Ex[i].Idata32[j/2] and Acc72Ex[i].Udata32[j/2]. It is the user's responsibility to prevent possible multiple uses of the same register.

In C, this element should be accessed through the C functions ACC72EX\_GetUdata16 and ACC72EX\_SetUdata16 described later in this manual.

#### Acc72EX[i].Idata32[i]

Description: Dual Ported RAM "signed 32-bit integer" data array element

Range:  $-2^{31} ... 2^{31}-1$ 

Units: address dependent

Power-on default: address dependent

Acc72Ex[i].Idata32[j] is the "jth" signed 32-bit integer data array element in the Acc72EX[i] dual-ported RAM. Each of these elements occupies four bytes in the DPRAM, and is located starting at 4\*j addresses past the beginning of the buffer (which is located at the address in Acc72EX[i].a). This array is defined based upon the Hilscher ComX memory map.

Index values *j* in the square brackets can be integer constants in the range 0 to 131,072, or local L-variables. No expressions or non-integer constants are permitted. The size of the DPRAM is dependent on the ACC-72EX communication option and installed Hilscher ComX module.

Acc72Ex[i].Idata32[j] is located in the same registers as Acc72Ex[i].Data8[4\*j] to Acc72Ex[i].Data8[4\*j+5], Acc72Ex[i].Idata16[2\*j] to Acc72Ex[i].Idata16[2\*j+1], Acc72Ex[i].Udata16[2\*j] to Acc72Ex[i].Udata16[2\*j+1] and Acc72Ex[i].Udata32[j]. It is the user's responsibility to prevent possible multiple uses of the same register.

In C, this element should be accessed through the C functions ACC72EX\_GetIdata32 and ACC72EX\_SetIdata32 described later in this manual.

### Acc72EX[i].Udata32[i]

Description: Dual Ported RAM "unsigned 16-bit integer" data array element

Range:  $0 ... 2^{32}-1$ 

Units: address dependent

Power-on default: address dependent

**Acc72Ex**[*i*].**Udata32**[*j*] is the "*j*th" unsigned 32-bit integer data array element in the **Acc72EX**[*i*] dual ported RAM. Each of these elements occupies four bytes in the DPRAM, and is located starting at **4**\**j* addresses past the beginning of the buffer (which is located at the address in **Acc72EX**[*i*].a). This array is defined based upon the Hilscher ComX memory map.

Index values j in the square brackets can be integer constants in the range 0 to 262,143, or local L-variables. No expressions or non-integer constants are permitted. The size of the DPRAM is dependent on the ACC-72EX communication option and installed Hilscher ComX module.

Acc72Ex[i].Udata32[j] is located in the same registers as Acc72Ex[i].Data8[4\*j] to Acc72Ex[i].Data8[4\*j+5], Acc72Ex[i].Idata16[2\*j] to Acc72Ex[i].Idata16[2\*j+1], Acc72Ex[i].Udata16[2\*j] to Acc72Ex[i].Udata16[2\*j+1] and Acc72Ex[i].Idata32[j]. It is the user's responsibility to prevent possible multiple uses of the same register.

In C, this element should be accessed through the C functions ACC72EX\_GetUdata32 and ACC72EX\_SetUdata32 described later in this manual.

## C Programming Access to ACC-72EX Structures

One can use the following header file full of functions to read from and write to the aforementioned **Acc72EX**[*i*] structures from a C program. The input argument CardIndex is *i* and ArrayIndex is *j* as above. Use the "Get" functions to retrieve the structure values; use the "Set" functions to write to the structures. In the "Set" functions, the Input argument is the value to which to set the structure.

```
int Acc72EX GetIdata32(unsigned int CardIndex, unsigned int ArrayIndex);
unsigned int Acc72EX GetUdata32 (unsigned int CardIndex, unsigned int ArrayIndex);
short Acc72EX GetIdata16(unsigned int CardIndex, unsigned int ArrayIndex);
char Acc72EX GetData8(unsigned int CardIndex, unsigned int ArrayIndex);
unsigned short Acc72EX GetUdata16(unsigned int CardIndex, unsigned int ArrayIndex);
void Acc72EX SetIdata16 (unsigned int CardIndex, unsigned int ArrayIndex, short Input);
void Acc72EX SetUdata16 (unsigned int CardIndex, unsigned int ArrayIndex, unsigned short Input);
void Acc72EX_SetIdata32(unsigned int CardIndex, unsigned int ArrayIndex, int Input);
void Acc72EX SetUdata32 (unsigned int CardIndex, unsigned int ArrayIndex, unsigned int Input);
void Acc72EX SetData8(unsigned int CardIndex, unsigned int ArrayIndex, char Input);
short Acc72EX GetIdata16(unsigned int CardIndex, unsigned int ArrayIndex)
       unsigned int *myptr = (unsigned int *)piom + (DPRCSBase + CardIndex * 0x100000) / 4;
       return (short) ((myptr[ArrayIndex] << 8) >> 16);
unsigned short Acc72EX GetUdata16(unsigned int CardIndex, unsigned int ArrayIndex)
       unsigned int *myptr = (unsigned int *)piom + (DPRCSBase + CardIndex * 0x100000) / 4;
       return (unsigned short)((myptr[ArrayIndex] << 8) >> 16);
char Acc72EX GetData8 (unsigned int CardIndex, unsigned int ArrayIndex)
       unsigned int *myptr = (unsigned int *)piom + (DPRCSBase + CardIndex * 0x100000) / 4;
return (myptr[ArrayIndex / 2] << (16 / (1 + (ArrayIndex % 4) % 2))) >> 24;
unsigned int Acc72EX GetUdata32(unsigned int CardIndex, unsigned int ArrayIndex)
       unsigned int i = ArrayIndex * 4, j, k = 0;
       unsigned int out = 0;
       for (j = i; j \le i + 3; j++)
               out |= (unsigned int)((unsigned int)Acc72EX GetData8(CardIndex, j) << (8 * k));</pre>
       return out:
int Acc72EX GetIdata32 (unsigned int CardIndex, unsigned int ArrayIndex)
       return (int)Acc72EX GetUdata32(CardIndex, ArrayIndex);
void Acc72EX SetIdata16(unsigned int CardIndex, unsigned int ArrayIndex, short Input)
       unsigned int *myptr = (unsigned int *)piom + (DPRCSBase + CardIndex * 0x100000) / 4;
       myptr[ArrayIndex] = (Input << 8) & 0x00FFFF00;</pre>
void Acc72EX SetUdata16(unsigned int CardIndex, unsigned int ArrayIndex, unsigned short Input)
       unsigned int *myptr = (unsigned int *)piom + (DPRCSBase + CardIndex * 0x100000) / 4;
       myptr[ArrayIndex] = (Input << 8) & 0x00FFFF00;</pre>
```

```
void Acc72EX_SetIdata32(unsigned int CardIndex, unsigned int ArrayIndex, int Input)
{
    unsigned int *myptr = (unsigned int *)piom + (DPRCSBase + CardIndex * 0x100000) / 4;
    myptr[ArrayIndex] = ((Input << 16) >> 8);
    myptr[ArrayIndex + 1] = ((Input >> 16) << 8);
}

void Acc72EX_SetUdata32(unsigned int CardIndex, unsigned int ArrayIndex, unsigned int Input) {
    unsigned int *myptr = (unsigned int *)piom + (DPRCSBase + CardIndex * 0x100000) / 4;
    myptr[ArrayIndex] = (Input << 16) >> 8;
    myptr[ArrayIndex + 1] = ((Input >> 16) << 8);
}

void Acc72EX_SetData8(unsigned int CardIndex, unsigned int ArrayIndex, char Input) {
    unsigned int *myptr = (unsigned int *)piom + (DPRCSBase + CardIndex * 0x100000) / 4;
    unsigned int shift = (8 * (1 + ArrayIndex * 2));
    unsigned int ind = ArrayIndex / 2;
    myptr[ind] &= ~(0x000000FF << shift);
    myptr[ind] |= (Input << shift);
    myptr[ind] |= (Input << shift);</pre>
```

## **Global Header for Power PMAC Projects**

This section provides example for header files which allow use of native netX variable names rather than using Power PMAC structures. The following header file is written as generically as possible allowing access to most used registers in System, Handshake and Communication Channels.

```
/* ACC-72EX Power PMAC Project Header
/\star This header file provides macro definitions for most common registers in Hilsche COMX modules
/* used in ACC-72EX.
/* Instructions:
/* Uncomment the related #define depending on ACC-72EX option

#### **Initialization PLC**

Recall that ACC-72EX requires a reset after each power up, power cycle, \$\$\$ (reset), or \$\$\$\*\*\* (factory default reset). This can be achieved with a startup (or initialization) PLC. Example:

```
// ACC-72EX initialization PLC
open plc Acc72EX StartupPLC
local endtime;
disable plc 2..31
                                                   // Disable all other tasks
// Defining pointers for system channel mailboxes
L0 = 0
while (L0 < 84)
      CMD"SSMB Data8(%d) ->Acc72Ex[0].Data8[%d]",L0,L0+300
      sendallcmds
      L0++
L0 = 0
while (L0<42)
{
      CMD"SSMB Data16(%d) ->Acc72Ex[0].uData16[%d]",L0,L0+150
      sendallcmds
      L0++
L0 = 0
while (L0<21)
      CMD"SSMB Data32(%d)->Acc72Ex[0].uData32[%d]",L0,L0+75
      sendallcmds
      L0++
L0 = 0
while (L0 < 84)
      CMD"SRMB Data8(%d) ->Acc72Ex[0].Data8[%d]",L0,L0+428
      sendallcmds
      L0++
L0 = 0
while (L0<42)
      CMD"SRMB Data16(%d)->Acc72Ex[0].uData16[%d]",L0,L0+214
      sendallcmds
```

```
L0++
L0=0
while (L0<21)
      CMD"SRMB Data32(%d)->Acc72Ex[0].uData32[%d]",L0,L0+107
      T_10 + +
// Defining pointers to Out/In PDOs
L0 = 0
while (LO<CCO_PDO_OUT_SIZE_2BYTE)
      CMD"CC0 PD0 OUT16(%d)->Acc72Ex[0].uData16[%d]",L0,L0+CC0 PD0 OUT OFFSET
_2BYTE;
      sendallcmds
      L0++
L0 = 0
while (LO< CCO PDO IN SIZE 2BYTE)
      CMD"CC0 PD0 IN16(%d)->Acc72Ex[0].uData16[%d]",L0,L0+CC0 PD0 IN OFFSET 2
BYTE
      sendallcmds
      L0++
L0 = 0
while (LO<CCO PD1 OUT SIZE 2BYTE)
      CMD"CC0 PD1 OUT16(%d)->Acc72Ex[0].uData16[%d]",L0,L0+CC0 PD1 OUT OFFSET
2BYTE
      sendallcmds
      L0++
L0 = 0
while (LO< CCO PD1 IN SIZE 2BYTE)
      CMD"CC0 PD1 IN16(%d) ->Acc72Ex[0].uData16[%d]", L0, L0+
CCO PD1 IN OFFSET 2BYTE
      sendallcmds
      L0++
SCtrl_ulSystemCommandCOS=$55AA55AA
                                           // Reset token for MASTER Unit
HCSC HSF RESET=1
                                    // Reset bit, token required for reset to
complete
CommErrorFlag=0;
                                           // Reset Time-out Timer
endtime = Sys.Time + 2;
while (CommErrorFlag==0 && HCSC NSF READY==0) // Wait for reset to complete
      if (endtime<Sys.Time)</pre>
                                                 // Check for reset timeout
            CommErrorFlag = 1;
call Timer(0.100); // 100 msec
```

The above PLC uses a Timer subprogram call that must be added to the PMAC Script Language > Libraries folder of the IDE project:

```
open subprog Timer(wait_duration) // wait_duration in seconds
local EndTime = Sys.Time + wait_duration;
while(Sys.Time < EndTime){}
close</pre>
```

### **Startup**

To enable this startup PLC at power-up or reset, add the following line to pp\_startup.txt in the Configuration folder:

```
enable plc Acc72EX_StartupPLC
```

# Watchdog Function

The host Watchdog and the device Watchdog cells in the control block of each of the communication channels allow the operating system running on the netX to supervise the host or UMAC application and vice versa. There is no Watchdog function for the system block or for the handshake channel. The Watchdog for the channels is located in the control block of the status block of each communication channel.

The netX firmware reads the content of the device Watchdog cell, increments the value by one and copies it back into the host Watchdog location. Then, the application has to copy the new value from the host Watchdog location into the device Watchdog location. Copying the host Watchdog cell to the device Watchdog cell has to happen in the configured Watchdog time. When the overflow occurs, the firmware starts over and a one appears in the host Watchdog cell. A zero turns off the Watchdog and therefore never appears in the host Watchdog cell in the regular process.

The minimum Watchdog time is 20 ms. The application can start the Watchdog function by copying any value unequal to zero into device Watchdog cell. A zero in the device Watchdog location stops the Watchdog function. The Watchdog timeout is configurable in SYCON.net and downloaded to the netX firmware.

If the application fails to copy the value from the host Watchdog location to the device Watchdog location within the configured Watchdog time, the protocol stack will interrupt all network connections

immediately, regardless of their current state. If the Watchdog tripped, then power cycling, channel reset, or channel initialization will allow the communication channel to open network connections again.

Here is sample code for copying the host Watchdog location to the device Watchdog location:

```
/**********************************

// ACC-72EX Watchdog PLC

/*************************

open plc Acc72EX_WatchdogPLC

CC0_ulDeviceWatchdog = CC0_ulHostWatchdog // copies the host Watchdog content

// to device Watchdog cell

// for the ACC-72EX

close
```

# **Enabling the Communication Bus**

Using the Bus On flag (CCx\_RCX\_APP\_COS\_BUS\_ON, where x is the communication channel number), the host or UMAC application allows or disallows the netX firmware to open network connections. This flag is used together with the Bus On Enable flag

(CCx\_RCX\_APP\_COS\_BUS\_ON\_ENABLE, where x is the communication channel number). If set, the netX firmware tries to open network connections; if cleared, no connections are allowed, and open connections are closed. If the Bus On Enable flag is set, it enables the execution of the Bus On command in the netX firmware.

# Locating the Input/Output Data Image in PMAC

The header file provided for use with ACC-72EX provides proper addressing and offsets for each of the PDOs available for each communication module. There are also pointers declared in the header file and are defined as a part of the initialization PLC shown above. These pointers will be used to access different PDOs defined by SYCON.net software.

The following example PLCs are for reference only in order to demonstrate the proper handshaking necessary for reading and writing data to ACC-72EX from Power PMAC.

```
/************
// ACC-72EX Writing to PDO Sample PLC
open plc Acc72EX PDO WritePLC
if (HCCCO HCF PDO OUT CMD == HCCCO NCF PDO OUT ACK)
// Making sure the ACK flag matches the CMD
// flag before writing the value to the
// output data image register
     P200=P200+1
     CCO PDO OUT16(0) = P200; // write the output data image register
     // Toggle the CMD flag (^: XOR)
     HCCCO HCF PDO OUT CMD = HCCCO HCF PDO OUT CMD^1
     // indicating write completion
close
/**********************************
// ACC-72EX Reading from PDO Sample PLC
```

# **DIAGNOSTICS**

### **LEDs**

There is one system LED (SYS LED) per ACC-72EX. SYS LED is always present as described below. There are up to 4 LEDs per communication and application channel. These LEDs, like the communication channel LED (COM LED), are network-specific and are described separately.

#### SYS LED

The system status LED (SYS LED) is always available. It indicates the state of the system and its protocol stacks. The following blink patterns are defined:

Color	State	Meaning
Yellow	Flashing Cyclically at 1 Hz	netX is in Boot Loader Mode and is Waiting for Firmware
		Download
	Solid	netX is in Boot Loader Mode, but an Error Occurred
Green	Solid	netX Operating System is Running and a Firmware is Started
Vellow /	Flashing Alternating	2nd Stage Bootloader is active
Green		
Off	N/A	netX has no Power Supply or Hardware Defect Detected

#### PROFIBUS-DP - Master - OPT10

The following table describes the meaning of the LEDs for the comX PROFIBUS-DP Master communication modules (COMX 100CA-DP/ COMX100CN-DP) when the firmware of the PROFIBUS DP Master protocol is loaded to the comX communication module:

### COM LED (COM0)

Color	State	Meaning
Green	Flashing acyclic	No configuration or stack error
Green	Flashing cyclic	Profibus is configured, but bus communication is not yet released from the application
Green	On	Communication to all Slaves is established
Red	Flashing cyclic	Communication to at least one Slave is disconnected
Red	On	Communication to one/all Slaves is disconnected

#### PROFIBUS-DP - Slave - OPT11

The subsequent table describes the meaning of the LEDs for the comX PROFIBUS-DP Slave communication modules (COMX CA-DP/ COMX CNDP) when the firmware of the PROFIBUS DP Slave protocol is loaded to the comX communication module.

#### COM LED (COM0)

Color	State	Meaning
Green	On	RUN, cyclic communication
Red	Flashing cyclic	STOP, no communication, connection error
Red	Flashing acyclic	not configured

Diagnostics 108

#### **DeviceNet - Master - OPT20**

The following table describes the meaning of the LEDs for the comX communication modules when the firmware of the DeviceNet Master protocol is loaded to the comX communication module:

#### MNS LED (COM0)

Color	State	Meaning
Green	On	Device is online and has established one or more
		connections
Green	Flashing	Device is online and has established no connection
Green/Red	Green/Red/Off	Self-test after power on:
		Green on for 0,25 s, then red on for 0,25 s, then off
Red	Flashing	Connection timeout
Red	On	Critical connection failure; device has detected a network error: duplicate MAC-
		ID or severe error in CAN network (CAN-bus off)
Red	Off	After start of the device and during duplicate MAC-ID check

#### DeviceNet - Slave - OPT21

The following table describes the meaning of the LEDs for the comX communication modules when the firmware of the DeviceNet Slave protocol is loaded to the comX communication module:

#### MNS LED (COM0)

Color	State	Meaning
Green	On	Device is online and has established one or more
		connections
Green	Flashing	Device is online and has established no connection
Green/Red	Green/Red/Off	Self-test after power on:
		Green on for 0,25 s, then red on for 0,25 s, then off
Red	Flashing	Connection timeout
Red	On	Critical connection failure; device has detected a network error: duplicate MAC-
		ID or severe error in CAN network (CAN-bus off)
Red	Off	After start of the device and during duplicate MAC-ID check

## **CANopen – Master – OPT30**

The following table describes the meaning of the LEDs for the comX CANopen Master communication modules (COMX-CA-CO/ COMX-CNCOM) when the firmware of the CANopen Master protocol is loaded to the comX communication module:

#### CAN LED (COM0)

Color	State	Meaning
Green	Off	The device is executing a reset
Green	Single Flash	STOPPED: The Device is in STOPPED state
Green	Blinking	PREOPERATIONAL: The Device is in the PREOPERATIONAL state
		The indicator turns on and off with a frequency of 2,5 Hz: on for 200 ms,
		followed by off for 200 ms.
Green	On	OPERATIONAL: The Device is in the OPERATIONAL state
Red	Single flash	Warning Limit reached: At least one of the error counters of the CAN controller
		has reached or exceeded the warning level (too many error frames).
		The indicator shows one short flash (200 ms) followed by a long off phase
		(1,000 ms).
Red	Double flash	Error Control Event: A guard event (NMT Slave or NMTmaster) or a heartbeat
		event (Heartbeat consumer) has occurred.
		The indicator shows a sequence of two short flashes (each 200 ms), separated
		by a short off phase (200 ms). The sequence is finished by a long off phase
		(1,000 ms).
Red	On	Bus Off: The CAN controller is bus off

### **CANopen - Slave - OPT31**

The following table describes the meaning of the LEDs for the comX CANopen Slave communication modules (COMX-CA-CO/ COMX-CNCOS) when the firmware of the CANopen Slave protocol is loaded to the comX communication module:

## CAN LED (COM0)

Color	State	Meaning
Green	Off	The device is executing a reset
Green	Single Flash	STOPPED: The Device is in STOPPED state
Green	Blinking	PREOPERATIONAL: The Device is in the PREOPERATIONAL state The indicator turns on and off with a frequency of 2,5 Hz: on for 200 ms, followed by off for 200 ms.
Green	On	OPERATIONAL: The Device is in the OPERATIONAL state
Red	Off	No Error: The Device is in working condition
Red	Single flash	Warning Limit reached: At least one of the error counters of the CAN controller has reached or exceeded the warning level (too many error frames).  The indicator shows one short flash (200 ms) followed by a long off phase (1,000 ms).
Red	Double flash	Error Control Event: A guard event (NMT Slave or NMTmaster) or a heartbeat event (Heartbeat consumer) has occurred.  The indicator shows a sequence of two short flashes (each 200 ms), separated by a short off phase (200 ms). The sequence is finished by a long off phase (1,000 ms).
Red	On	Bus Off: The CAN controller is bus off

#### CC-Link - Slave - OPT51

The following table describes the meaning of the LEDs for the comX CCLink Slave communication modules (COMX 100CA-CCS/ COMX 100CNCCS) when the firmware of the CC-Link Slave protocol is loaded to the comX communication module:

## **RUN/ERR LED (COM0)**

Color	State	Meaning
Green	Off	Before participating in the network
		2. Unable to detect carrier
		3. Timeout
		4. Resetting hardware
Green	On	Receive both refresh and polling signals or just the refresh signal normally, after
		participating in the network.
Red	Off	1. Normal communication
		2. Resetting hardware
Red	Blinking	The switch setting has been changed from the setting at the reset cancellation
		(blinks for 0.4 sec.).
Red	On	1. CRC error
		2. Address parameter error (0, 65 or greater is set including the number of
		occupied stations)
		3. Baud rate switch setting error during cancellation of reset (5 or greater)

#### EtherCAT - Master - OPT60

The following table describes the meaning of the LEDs for the comX Real-Time Ethernet communication modules (COMX 100CA-RE/ COMX 100CN-RE) when the firmware of the EtherCAT Master protocol is loaded to the comX communication module:

#### **RUN LED (COM0)**

Color	State	Meaning
Green	Off	INIT: The device is in state INIT
Green	Blinking	PRE-OPERATIONAL: The device is in PREOPERATIONAL state
Green	Flickering	BOOT: Device is in BOOT state
Green	Single Flash	SAFE-OPERATIONAL: The device is in SAFE-OPERATIONAL state
Green	On	OPERATIONAL: The device is in OPERATIONAL state

#### ERR LED (COM1)

Color	State	Meaning
Red	Off	Master has no errors
Red	On	Master has detected a communication error. The error is indicated in the DPM

#### **LINK LED**

Green LED on ETH0 connector

Color	State	Meaning
Green	On	A link is established
Green	Off	No link established

#### **ACT LED**

Yellow LED on ETH0 connector

Color	State	Meaning
Yellow	Flashing	The device sends/receives Ethernet frames

## LED State Definition for EtherCAT Master for the RUN and ERR LEDs

Color	Meaning	
On	The indicator is constantly on.	
Off	The indicator is constantly off.	
Blinking	The indicator turns on and off with a frequency of 2,5 Hz: on for 200 ms, followed by off for 200 ms.	
Flickering	The indicator turns on and off with a frequency of approximately 10 Hz: on for approximately 50 ms, followed	
	by off for 50 ms.	
Single Flash	The indicator shows one short flash (200 ms) followed by a long off phase (1,000 ms).	
Double Flash	The indicator shows a sequence of two short flashes (each 200 ms), separated by a short off phase (200 ms).	
	The sequence is finished by a long off phase (1,000 ms).	

#### EtherCAT - Slave - OPT61

The following table describes the meaning of the LEDs for the comX Real-Time Ethernet communication modules (COMX 100CA-RE/ COMX 100CN-RE) when the firmware of the EtherCAT Slave protocol is loaded to the comX communication module:

#### **RUN LED (COM0)**

Color	State	Meaning
Green	Off	INIT: The device is in state INIT
Green	Blinking	PRE-OPERATIONAL: The device is in PREOPERATIONAL state
Green	Flickering	BOOT: Device is in BOOT state
Green	Single Flash	SAFE-OPERATIONAL: The device is in SAFE-OPERATIONAL state
Green	On	OPERATIONAL: The device is in OPERATIONAL state

#### ERR LED (COM1)

Color	State	Meaning
Red	Off	No error: The EtherCAT communication of the device is in working condition
Red	Blinking	Invalid Configuration: General Configuration Error Possible reason: State change commanded by master is impossible due to register or object settings.
Red	Single Flash	Local Error: Slave device application has changed the EtherCAT state autonomously.  Possible reason 1: A host Watchdog timeout has occurred.  Possible reason 2: Synchronization Error, device enters Safe-Operational automatically.
Red	Double Flash	Application Watchdog Timeout: An application Watchdog timeout has occurred. Possible reason: Sync Manager Watchdog timeout.

#### LINK/ACT LED

Green LED on ETH0(IN) / ETH1(OUT) connectors:

Color	State	Meaning
Green	On	A link is established
Green	Flashing	The device sends/receives Ethernet frames
Green	Off	No link established

#### Yellow LED on ETH0 / ETH1 connectors:

Color	State	Meaning
Yellow	-	-

# LED State Definition for EtherCAT Slave for the RUN and ERR LEDs

Color	Meaning
On	The indicator is constantly on.
Off	The indicator is constantly off.
Blinking	The indicator turns on and off with a frequency of 2,5 Hz: on for 200 ms, followed by off for 200 ms.
Single Flash	The indicator shows one short flash (200 ms) followed by a long off phase (1,000 ms).
Double Flash	The indicator shows a sequence of two short flashes (each 200 ms), separated by a short off phase (200 ms).
	The sequence is finished by a long off phase (1,000 ms).

# EtherNet/IP - Scanner/Master - OPT70

The following table describes the meaning of the LEDs for the comX Real-Time Ethernet communication modules (COMX-CA-RE/ COMX-CNRE) when the firmware of the EtherNet/IP Scanner (Master) protocol is loaded to the comX communication module:

#### MS LED (COM0)

Color	State	Meaning
Green	On	Device operational: If the device is operating correctly, the module status
		indicator shall be steady green.
Green	Flashing	Standby: If the device has not been configured, the module status indicator
		shall be flashing green.
Red	On	Major fault: If the device has detected a non-recoverable major fault, the
		module status indicator shall be steady red.
Green	Flashing	Minor fault: If the device has detected a recoverable minor fault, the module
		status indicator shall be flashing red. NOTE: An incorrect or inconsistent
		configuration would be considered a minor fault.
Red/Green	Flashing	Self-test: While the device is performing its power up testing, the module status
		indicator shall be flashing green/red.
-	Off	No power: If no power is supplied to the device, the module status indicator
		shall be steady off.

#### NS LED (COM1)

Color	State	Meaning
Green	On	Connected: If the device has at least one established connection (even to the
		Message Router), the network status indicator shall be steady green.
Green	Flashing	No connections: If the device has no established connections, but has obtained
		an IP address, the network status indicator shall be flashing green.
Red	On	Duplicate IP: If the device has detected that its IP address is already in use, the
		network status indicator shall be steady red.
Red	Flashing	Connection timeout: If one or more of the connections in which this device is
		the target has timed out, the network status indicator shall be flashing red. This
		shall be left only if all timed out connections are reestablished or if the device is
		reset.
Red/Green	Flashing	Self-test: While the device is performing its power up testing, the network
		status indicator shall be flashing green/red.
-	Off	Not powered, no IP address: If the device does not have an IP address (or is
		powered off), the network status indicator shall be steady off.

#### **LINK LED**

Green LED on ETH0 / ETH1 connectors:

Color	State	Meaning
Green	On	A connection to the Ethernet exists
Green	Off	The device has no connection to the Ethernet

#### **ACT LED**

Yellow LED on ETH0 / ETH1 connectors:

Color	State	Meaning
Yellow	Flashing	The device sends/receives Ethernet frames

# EtherNet/IP - Adaptor/Slave - OPT71

The following table describes the meaning of the LEDs for the comX Real-Time Ethernet communication modules (COMX-CA-RE/ COMX-CNRE) when the firmware of the EtherNet/IP Adapter (Slave) protocol is loaded to the comX communication module:

## MS LED (COM0)

Color	State	Meaning
Green	On	Device operational: If the device is operating correctly, the module status
		indicator shall be steady green.
Green	Flashing	Standby: If the device has not been configured, the module status indicator
		shall be flashing green.
Red	On	Major fault: If the device has detected a non-recoverable major fault, the
		module status indicator shall be steady red.
Green	Flashing	Minor fault: If the device has detected a recoverable minor fault, the module
		status indicator shall be flashing red. NOTE: An incorrect or inconsistent
		configuration would be considered a minor fault.
Red/Green	Flashing	Self-test: While the device is performing its power up testing, the module status
		indicator shall be flashing green/red.
-	Off	No power: If no power is supplied to the device, the module status indicator
		shall be steady off.

#### NS LED (COM1)

Color	State	Meaning
Green	On	Connected: If the device has at least one established connection (even to the
		Message Router), the network status indicator shall be steady green.
Green	Flashing	No connections: If the device has no established connections, but has obtained
		an IP address, the network status indicator shall be flashing green.
Red	On	Duplicate IP: If the device has detected that its IP address is already in use, the
		network status indicator shall be steady red.
Red	Flashing	Connection timeout: If one or more of the connections in which this device is
		the target has timed out, the network status indicator shall be flashing red. This
		shall be left only if all timed out connections are reestablished or if the device is
		reset.
Red/Green	Flashing	Self-test: While the device is performing its power up testing, the network
		status indicator shall be flashing green/red.
-	Off	Not powered, no IP address: If the device does not have an IP address (or is
		powered off), the network status indicator shall be steady off.

#### **LINK LED**

Green LED on ETH0 / ETH1 connectors:

Color	State	Meaning
Green	On	A connection to the Ethernet exists
Green	Off	The device has no connection to the Ethernet

#### **ACT LED**

Yellow LED on ETH0 / ETH1 connectors:

Color	State	Meaning
Yellow	Flashing	The device sends/receives Ethernet frames

# **Open Modbus/TCP - OPT80**

The following table describes the meaning of the LEDs for the comX Real-Time Ethernet communication modules (COMX 100CA-RE/ COMX 100CN-RE) when the firmware of the Open Modbus/TCP protocol is loaded to the comX communication module:

#### **RUN LED (COM0)**

Color	State	Meaning
Green	Off	Not Ready
		OMB task is not ready
Green	Flashing cyclic with 1Hz	Ready, not configured yet
		OMB task is ready and not configured yet
Green	Flashing cyclic with 5Hz	Waiting for Communication:
		OMB task is configured
Green	On	Connected:
		OMB task has communication – at least one TCP connection is established

# ERR LED (COM1)

Color	State	Meaning
Red	Off	No communication error
Red	Flashing cyclic with 2Hz (On/Off ratio 25%)	System error
Red/Green	On	Communication error active

#### **LINK LED**

Green LED on ETH0 / ETH1 connectors:

Color	State	Meaning		
Green	On	A connection to the Ethernet exists		
Green	Off	The device has no connection to the Ethernet		

# **ACT LED**

Yellow LED on ETH0 / ETH1 connectors:

Color State		Meaning			
Yellow	Flashing	The device sends/receives Ethernet frames			

# **PROFINET IO – Controller – OPT90**

The following table describes the meaning of the LEDs for the comX Real-Time Ethernet communication modules (COMX 100CA-RE/ COMX 100CN-RE) when the firmware of the PROFINET IO-RT Controller protocol is loaded to the comX communication module:

#### SF LED (COM0)

\	,					
Color	State	Meaning				
Red	On	(together with BF "red ON") No valid Master license				
Red	Flashing cyclic with 2Hz	System error: Invalid configuration, Watchdog error or internal error				
Red	Off	No error				

#### BF LED (COM1)

Color	State	Meaning
Red	On	No Connection: No Link or (together with SF "red ON")
		No valid Master license
Red	Flashing cyclic with 2Hz	Configuration fault: not all configured IO-Devices are connected.
Red	Off	No error

#### **LINK LED**

Green LED on ETH0 / ETH1 connectors:

Color	State	Meaning
Green	On	A connection to the Ethernet exists
Green	Off	The device has no connection to the Ethernet

#### **ACT LED**

Yellow LED on ETH0 / ETH1 connectors:

Color	State	Meaning
Yellow	Flashing	The device sends/receives Ethernet frames

#### **PROFINET IO – Device – OPT91**

The following table describes the meaning of the LEDs for the comX Real-Time Ethernet communication modules (COMX-CA-RE/ COMX-CNRE) when the firmware of the PROFINET IO-RT-Device protocol is loaded to the comX communication module:

## SF LED (COM0)

Color	State	Meaning				
Red	On	Watchdog timeout; channel, generic or extended diagnosis present; system				
		error				
Red	Flashing cyclic with 2Hz	DCP signal service is initiated via the bus				
	(for 3 seconds)					
Red	Off	No error				

#### BF LED (COM1)

	, , , , , , , , , , , , , , , , , , , ,	
Color	State	Meaning
Red	On	No configuration; or low speed physical link; or no physical link
Red	Flashing cyclic with 2Hz	No data exchange
Red	Off	No error

#### **LINK LED**

Green LED on ETH0 / ETH1 connectors

Color	State	Meaning
Green	On	A connection to the Ethernet exists
Green	Off	The device has no connection to the Ethernet

#### **ACT LED**

Yellow LED on ETH0 / ETH1 connectors

Color	State	Meaning
Yellow	Flashing	The device sends/receives Ethernet frames

# **APPENDIX A - SETUP EXAMPLES**

# **SYCON.net Setup**

The following is a sample setup using an ACC-72EX Ethernet IP slave with an Allen-Bradley CompactLogix controller (1769-L18ERM-BB1B) as a master. SYCON.net for netX 1.310 was used in this example.

With the power off, plug the ACC-72EX into the UBUS backplane, and then power the UMAC rack. Connect the diagnostic port to a USB port on the PC using a micro-USB type cable.

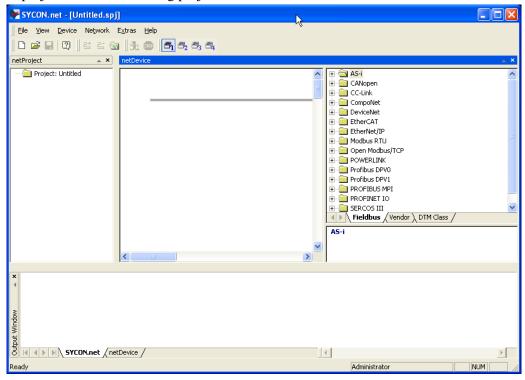

Launch the SYCON.NET software on the PC.

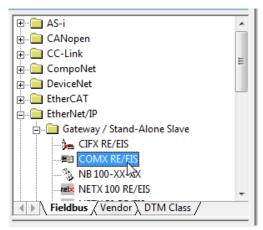

Enter the password:

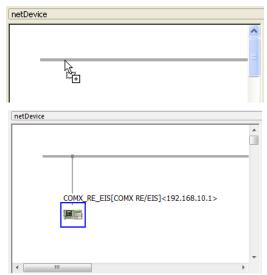

Start a new project or load an existing project from the File menu:

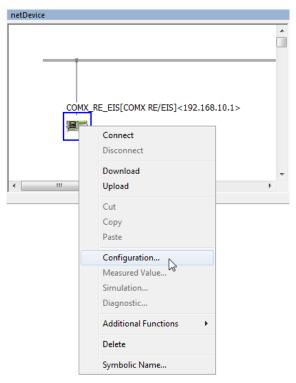

Select the COMX module, to which the USB is connected, from the Fieldbus protocol list:

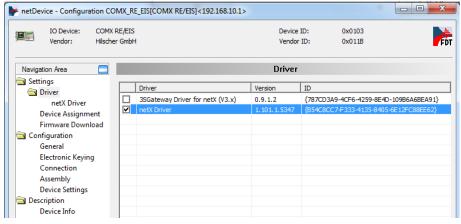

Drag and drop the module onto the BusLine in the netDevice window (notice that the module can only be inserted on the BusLine):

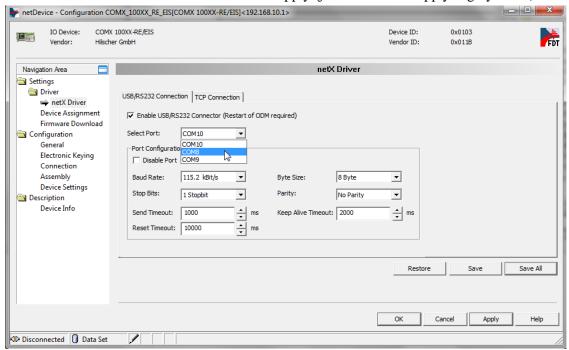

Establish USB communications to the COMX gateway by right clicking on the device icon and selecting "Configuration...":

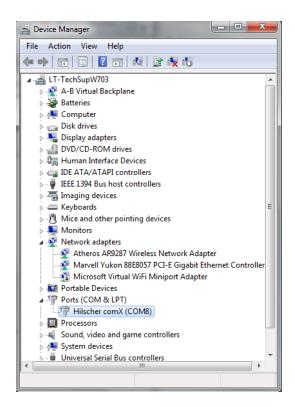

In the netDevice Configuration window, select the Driver folder under Settings folder in the Navigation Area, check the checkmark box for netX Driver on the driver list, and click Apply:

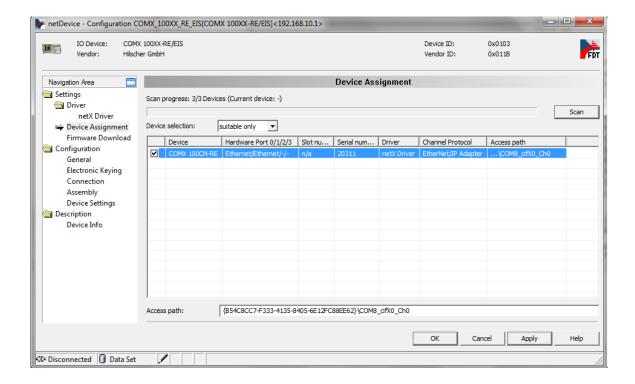

Select the netX Driver node in Driver folder in the Navigation Area, and select the port for the USB connection to the COMX module. Click Save and Apply (just click OK if Apply is grayed out):

Note: You can Check Windows Device Manager in order to identify which COM port provides the connection to the Hilscher COMX module:

Click the Device Assignment under Driver folder in the Navigation Area. Assign the netX Driver to the detected COMX module by checking the checkmark box next to the detected device, and click Apply:

Note

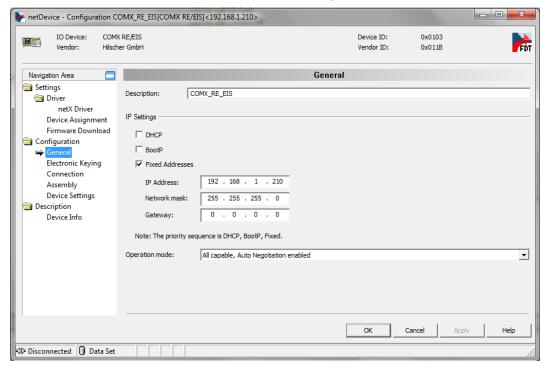

When used with Turbo PMAC, the reset line is released too fast for some Hilscher COMX modules, which puts them in a boot mode. This can prevent the device from being detected by Sycon.NET software. Make sure the device receives a system wide reset using the PMAC suggested M-variables ulSystemCommandCOS and HSF\_RESET registers as shown here.

SCtrl\_ulSystemCommandCOS=\$55AA55AA

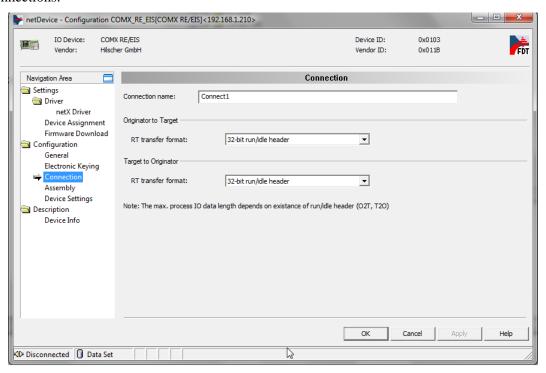

HCSC\_HSF\_RESET=1

Note that ACC-72EX Setup Assistant software automatically resets the cards if it cannot detect the identification cookie.

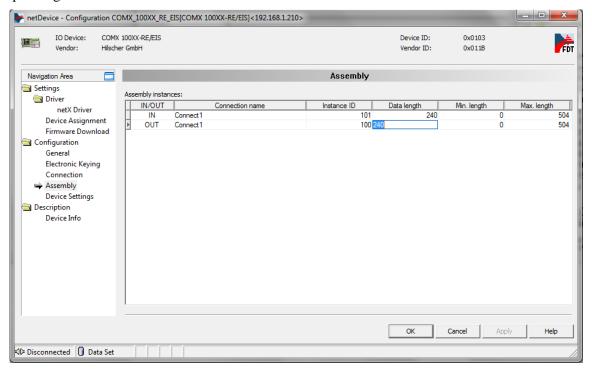

#### **Set Connections:**

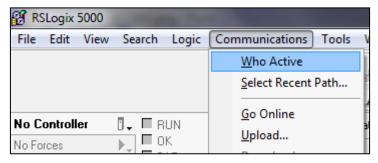

Set Instance IDs and Data lengths in the Assembly window. 240 is the maximum length for the CompactLogix 1769-L18ERM-BB1B controller.

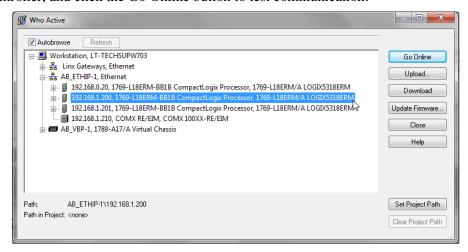

# **RSLogix 5000 Setup**

RSLogix 5000 version 20 is used in this example.

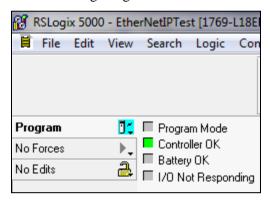

Launch RSLogix, and click on  $\underline{W}$ ho Active in the Communications pull down menu to find the CompactLogix controller:

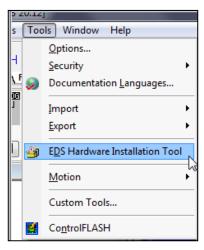

Select the controller, and click the Go Online button to test communication:

The Controller OK indicator box should change to green like below:

Next, install the EDS file for the Hilscher COMX slave of the ACC-72EX. Go to the Tools pull down menu, and select EDS Hardware Installation Tool:

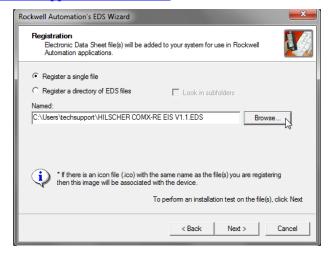

#### Click Next:

Select the Register an EDS file(s) radial button:

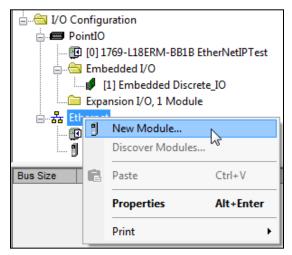

Browse to and select the Hilsher EDS file. EDS files can be downloaded at hilscher.com at <a href="http://www.hilscher.com/hcuk/support\_software.html">http://www.hilscher.com/hcuk/support\_software.html</a> . Click Next.

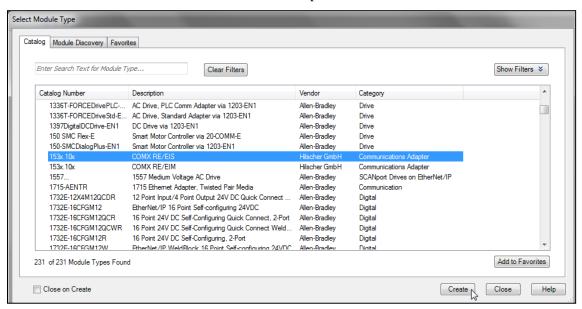

Follow the directions in the remaining windows for finishing the EDS installation.

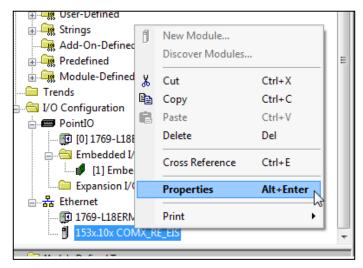

The next step will apply the EDS installation, but first the controller needs to be offline. Click the <u>Go</u> Offline selection under the Communications tab (<u>Go</u> Offline is displayed when the controller is online, and <u>Go</u> Online is displayed when offline). Under I/O Configuration in the Controller Organizer, right-click on Ethernet, and select New Module...:

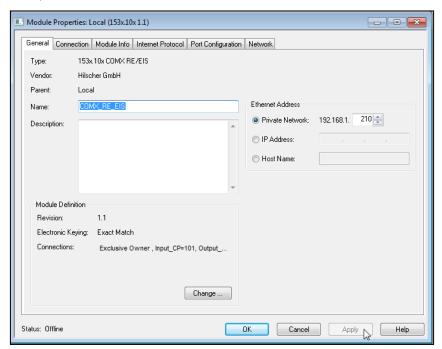

Scroll down to and select the COMX slave module, and press Create:

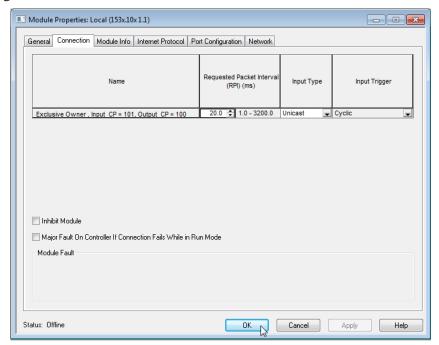

The created entry should appear under Ethernet in the Control Organizer. Right-click on it, and select Properties:

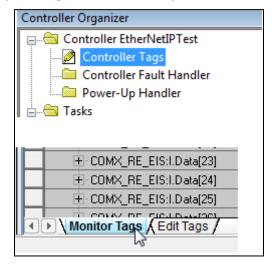

Under the General tab, set the IP address of the ACC-72EX:

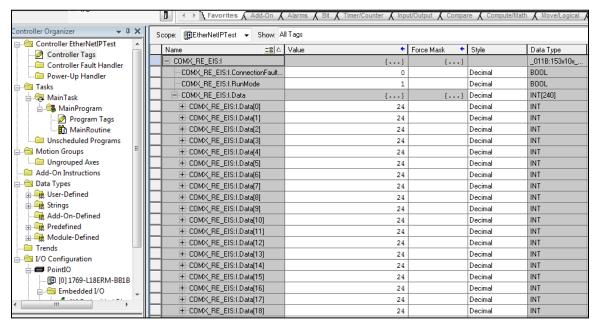

Check the settings under the Connection tab:

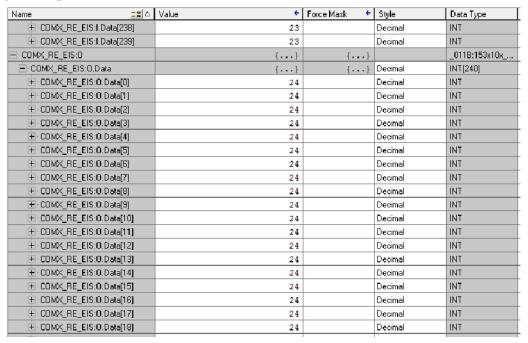

Double-click on Controller Tags, and open the Monitor Tags tab:

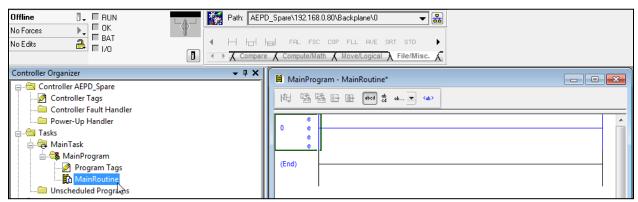

Click on "+" to expand the input data entries. Now input values from the ACC-72EX can be seen in the Value column (controller must be online).

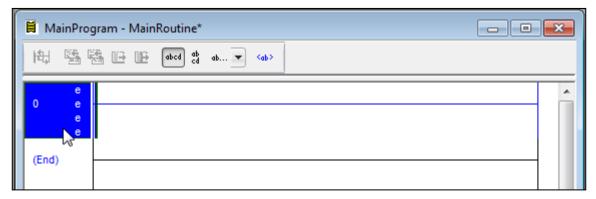

Click on "+" to expand the output data entries. The values seen in the Value column should now be seen as inputs in the ACC-72EX. Values can be changed here manually, or in program logic such as in the ladder logic example that follows.

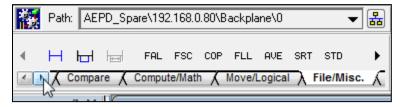

The following is an example which uses a "Copy" function to transfer all of the input values into corresponding output values. Double-click on MainRoutine:

Click to select the top rung:

Click on the right arrow as needed to bring into view the File/Misc. ladder entries tab:

Click on the File/Misc. tab, and then drag and drop COP (copy) onto a rung. Look for a green dot to appear on the left side of the rung when the cursor is hovered there, and then drop the COP function. To copy all the ACC-72EX inputs into corresponding CopactLogix outputs, set Source to COMX\_RE\_EIS:I.Data[0], Dest to COMX\_RE\_EIS:O.Data[0], and Length to 240:

#### **COMX Test PLC**

The following Turbo PMAC PLCs can be used to test the communication of the COMX module. Run PLC 1 and check the variable M\_CommErrorFlag. If it is =0 after PLC 1 finishes, the COMX module is communicating properly.

```
