NX-series Safety Controller

Stand-alone System

Directly connects to any PLC for monitoring and status
The NX Stand-alone Safety Controller is a powerful and robust Safety System that reaches the PLe according to EN 13849-1 and SIL3 according to IEC 61508. The EtherNet/IP coupler unit allows for connection to almost any PLC via EtherNet/IP™ or standard Ethernet communications. The flexible hardware allows the NX safety I/O units to be mixed in any combination with standard NX I/O units. Sysmac Studio software allows for configuration, programming, simulation and monitoring functionality.

**Safety**
- ISO 13849-1, Cat.4/PLe
- IEC 61508 SIL3
- EN 62061 SIL3
- IEC 61131-2
- IEC 61131-3
- PLCopen® FBD

**Versatility**
The EtherNet/IP coupler unit enables connections with various EtherNet/IP and standard Ethernet devices. You can monitor safety status and control standard I/O via the connected PLC.

**Connectivity**
The stand-alone system eliminates the need for dedicated controllers for safety input devices and allows for direct connection of safety input devices.

**Scalability**
The system allows up to 63 safety/standard I/O units per coupler; up to 32 safety I/O units to a maximum of 256 safety I/O signals. Configure systems with the right combination of I/O to optimize cost.

**Maintainability**
Detachable screwless terminal block
The detachable terminal block of the I/O unit simplifies the commissioning and maintenance tasks. Screwless push-in connections speed up installation.

**ACR (Automatic Configuration Restart)**
When replacing a safety I/O Unit, just remove the old unit and insert a new unit. The setting data is automatically downloaded without using the programming software.
Flexibility and reusability of programming code

Standard programming with Sysmac Studio

Sysmac Studio is compliant to the IEC 61131-3 standard and utilizes PLCopen® function blocks. The safety controller provides a large program capacity of 512 KB (equivalent to more than 1,000 function blocks), visual setting of IO and automatic generating wiring diagram, variable style programming, reusable user-defined function blocks, offline simulation and simple automatic test.

Visual setting of IO and automatic generating wiring diagram

By drag & drop the visual icon, the settings of I/Os are completed. Wiring diagrams are also automatically generated based on terminal settings. The wiring diagrams can be used for wiring check and Technical Construction Files (TCF).

Programming with variables

Unlike previous programming with physical addresses, programming with variables does not depend on the hardware configuration. You can use the same code for the machine with a different hardware configuration by flexibly changing connections between variable names and hardware memory addresses.

User-defined function blocks

You can define your own function blocks. Repeat use of user-defined function blocks cuts programming time and maintains consistency of quality. Secure the code with password protection and add user-defined help files to make re-using functions safe and easy.

Offline simulation and simple automatic test

You can check operation on the Simulator without physical devices. Furthermore, basing on the relationship between inputs and outputs, program can be tested automatically. This significantly reduces program modification and debugging time.
