

## Enable connectivity and leverage your automotive plant data

Industry 4.0 is changing the landscape for automotive manufacturers with data serving as a path towards increased productivity, better yields, and lower production and maintenance costs. By collecting real-time machine and process data, you can maintain the competitive edge by elevating your plant's operations with smart sensing solutions.

### E2E NEXT

IO Link enabled proximity sensors like the E2E NEXT from Omron, allow you to identify areas of improvement, monitor the lifespan of machine components, and accurately log runtime data. Using alarms in conjunction with the data can alert operators to potential issues before they become more serious and with up to four times the range of standard sensors, Omron sensors make for a flexible integration experience.

To schedule a demo and learn how to better leverage your plant data, contact your local rep today.
